The annual show run of the M.C.C. on the 22nd inst. is to Abercorn Arms, Stanmore. This place can be reached if the weather and roads are unfit for riding either by train from Euston, Willesden Green, Cricklewood, etc., to Edgware, whence it is a pleasant walk to Stanmore. Lunch is at 1.30. All motor cyclists visiting London for the show are cordially invited to join the M.C.C. in the run.

North-west London M.C.C.

The committee has arranged the winter programme as follows: 5th December, annual dinner; 2nd January, whist drive; 6th February, smoking concert; 27th February, whist drive (probable). It is also proposed to hold a dance in March. A billiard handicap has also been arranged. Will the members wishing to enter kindly send in their names at once to Mr. T. G. Blundell, jun., 30, Ferncroft Avenue, Hampstead? The closing run was held in conjunction with the Western District M.C. Although the roads were in a very bad state quite a large number of members sat down to dinner at the Bull, Gerrard's Cross.

Barnoldswick M.C.

The first annual dinner of the above club was held on Tuesday evening of last week, in the Seven Stars Hotel, the headquarters of the club. Mr. B. Holden presided. There were twenty-one members present. After dinner speeches were freely indulged in, and the following toasts were given: "The Barnoldswick Motor Club," "The King," "Army and Navy," "Officers of the Club," "The Host and Hostess." Subsequently the members adjourned to the concert room, where a capital programme was gone through. The report of the club was read and approved, and showed, after defraying expenses of the hill-climbs and trial, etc., during the year, there is a good surplus balance.

Cambridge University M.C.C.

In our report of the above club's private race meeting at Brooklands on the 11th inst., we gave the results of a scratch race for single-cylinder machines to decide a handicap. The handicap resulted as follows: 1st, H. Ashworth ($2\frac{3}{4}$ h.p. Minerva); 2nd, S. A. Yorke ($3\frac{1}{2}$ h.p. Bat); 3rd, N. H. Joy ($2\frac{3}{4}$ h.p. Minerva). Only half a machine's length separated the first and second riders.

In the handicap race for twin-cylinders not exceeding 76 mm. bore, R. O. Heyn (5 h.p. Rex) was the winner; G. Seth Smith (5 h.p. N.S.U.) 2nd; and F. A. Perkins ($3\frac{1}{2}$ h.p. Peugeot) 3rd.

The placing in the open race for twins not exceeding 76 mm. bore was: 1st, E. D. Dickson (5 h.p. Vindec); 2nd, E. H. Lees (5 h.p. King-Peugeot); 3rd, R. O. Heyn (5 h.p. Rex). Speed, $52\frac{1}{2}$ m.p.h.

In the open race for any motor cycle, E. H. Lees (5 h.p. King-Peugeot) was 1st, his speed equalling 52 m.p.h.; E. D. Dickson (5 h.p. Vindec) was 2nd; and W. B. R. Moorhouse (9 h.p. Jap) 3rd.

The race for twin-cylinder machines exceeding 76 mm. bore resulted as follows: 1st, B. Milburn (9 h.p. Bat); 2nd, W. B. R. Moorhouse (9 h.p. Jap); 3rd, F. M. F. Pilkington (7-9 h.p. Peugeot). The winner's speed was equal to $52\frac{1}{2}$ m.p.h.

Worcestershire M.C.C.

At a general meeting on the 14th inst. it was decided to arrange a winter programme on the following lines. Members to meet (weather permitting) at Bryants' Garage, Bromsgrove, on Saturday afternoons at three o'clock, Sunday mornings at eleven o'clock, and Sunday afternoons at three o'clock for short impromptu runs. It is hoped to be able to arrange a few interesting lectures later. Another important decision was to arrange a new class of membership at a 5s. subscription to admit associate members, and also motor cyclists who require the A.C.U. affiliation benefits, but do not desire to take part in the social events of the club. Further particulars of this scheme can be had on application to the secretary, H. C. Pickering, St. Brélade, Kings Norton.

Essex M.C.

The final of the inter-club contest with the West Essex Automobile Club has still to run, and it is suggested that this should take place on Sunday, the 29th inst. Further particulars will be announced.

The date of the annual dinner has been fixed for the 23rd January, to take place at the Great Eastern Hotel, Liverpool Street.

The following lectures have been arranged on the provisional dates stated, and members are asked to keep these evenings free: "Motor Cycles and Accessories," by Mr. H. G. Cove, on December 12th; "Magnetos," by Mr. H. M. Wyatt, on January 7th; "The Present Day Motor Cycle," by Mr. A. E. Lowe, on February 25th.

Birmingham M.C.C.

The Birmingham Motor Cycle Club commenced its annual autumn reliability trials on Saturday, the 7th inst. The following members entered the run: J. Troman ($3\frac{1}{2}$ h.p. Triumph), S. C. Perryman (5 h.p. Norton), J. L. Norton ($3\frac{1}{2}$ h.p. Norton), R. W. Duke ($3\frac{1}{2}$ h.p. Triumph), F. Brown ($3\frac{1}{2}$ h.p. Triumph), E. W. Winckle ($1\frac{1}{2}$ h.p. Clément), and E. C. F. Evans (5 h.p. Rex and sidecar). It will be remembered that the competition takes the form of a non-stop reliability run in conjunction with the usual Saturday afternoon runs, the last competitor to remain in to be the winner. The following competitors were run out on the first run: Evans, lamp trouble; Brown, filled lamp up at Stratford in contravention of the rules.

The second round of this club's reliability trials took place on Saturday last. Five members had qualified for this by making non-stop runs on the previous Saturday, but owing to the bad weather only four turned out—Messrs. Duke, Norton, Perryman, and Winckle. In spite of the condition of the roads, which were in places very bad, all made non-stop runs, and are therefore eligible for the next round, which will be on the 28th inst.

FUTURE EVENTS.

- Nov. 13-21—OLYMPIA AUTOMOBILE EXHIBITION.
 „ 18—Motor Union Annual Dinner at the Hotel Great Central, London.
 „ 20-28—THIRTY-SECOND ANNUAL STANLEY SHOW, at the Agricultural Hall, Islington.
 „ 22—Motor Cycling Club Annual Show Run.
 „ 23—General Committee Meeting of the A.C.U.
 „ 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.
 Dec. 12—Motor Cycling Club Annual Dinner.
 „ 16—Motor Union General Committee Meeting.
 Jan. 16-23—Motor Cycle Show at Madison Square Garden, New York.

Occasional Comments

By Ixion

Sidecar Attachments.

One or two correspondents inform me there is a type of rigid sidecar on the market fitted with special clips which enable the sidecar to be attached or detached in a couple of minutes. The main clips are designed to be permanent fixtures on the cycle frame after the right position has been discovered, but a set of subsidiary clips are included in the design which enable the sidecar to be taken off and replaced by removing three bolts.

Keep the Belt Clean.

Now that the bulk of our riding has to be done over muddy roads, it becomes of the first importance to attend to leather belts after every run, otherwise the pulley will soon be so badly worn as to set up chronic belt slip, and this is especially true of lightweights with small engine pulleys. Needless to say, it is neither leather nor rubber that wears the pulley groove from a straight-sided 28° to a round shouldered 60° or so. It is the grinding action of minute fragments of flint and grit flung on to the belt from the road and whirled round the pulleys at high speeds. The patent belt-cleaning shoe recently reviewed is a smart notion for the purpose, but, in any case, the belt must be regularly cleansed.

Electrical Condensers.

Will someone inform me why some makers of induction coils and magnetos are so careless about the efficiency of their condensers? For instance, in 1905 I owned a magneto on which the platina lasted upwards of 8,000 miles without pitting; in 1906 I bought a magneto of the same make, which devoured a pair of platina every 500 miles. The ordinary coil pits its platina badly within 1,000 miles; but once I made friends with a coil maker, and as a special favour he made me a coil (one of my dearest treasures to-day) which will not pit platina in 5,000 miles. Again I see that C. R. Collier in his recent hour record used a special coil, possessing a highly efficient condenser, and as a result, although his engine made upwards of 150,000 revolutions in that crowded hour, it evidently scarcely marked its platinum points at all, for it only slowed to a degree of about six per cent. It is therefore clearly possible to manufacture absolutely efficient condensers. If there are practical difficulties in the way of turning out every coil and every magneto with a perfect condenser, will some manufacturer kindly market a special guaranteed coil at a special price? At present the situation is that many condensers are thoroughly inefficient, and more than one ingenious firm has actually begun to market a separate condenser designed to correct the vagaries of existing coils.

Extra Light $3\frac{1}{2}$ h.p. Machines.

A correspondent writes asking advice about the best $3\frac{1}{2}$ h.p. single-cylinder engine for fitting to an extra light frame and wheels, a specification which he has

worked out himself, with the notion that the standard $3\frac{1}{2}$ h.p. machines are considerably heavier than they need be. I am willing to bet my correspondent a pair of tyres that his completed machine comes out heavier than a standard $3\frac{1}{2}$ h.p. motor cycle of well-known make. Some of our readers apparently fail to understand the immense forethought and ingenuity which the industry has lavished on the production of efficient light touring roadsters; quite as much trouble has been expended upon them as upon the famous makes of featherweight push bicycle. Weight has been pared off with rigid accuracy wherever an ounce could be saved without

E. H. Lees (5 h.p. Peugeot), winner of three lap scratch race at the Cambridge University M.C.C., Brooklands meeting.

sacrifice of roadworthiness. I question whether it is possible to compose out of any assemblage of parts and fittings a $3\frac{1}{2}$ h.p. roadster lighter than some of the standard makes. If any assembler professes to attain this object he can only do it by dispensing with fittings essential to an efficient roadster or by going short of the safety margin in point of strength. In addition, I must remind my correspondent that if he can by hook or crook evolve a lighter roadster with an engine of equal dimensions and flexibility than he could purchase from a well-known maker's stock, the machine would fetch less in proportion to a first-grade standard make when he wants to sell it. Of course, the great advantage of assembling a motor cycle from parts is that individual requirements can be more carefully followed.

QUESTIONS & REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E. C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Fitting a Non-skid Cover.

Q.

I have a $3\frac{1}{2}$ h.p. Raleighette tricar, weight $2\frac{1}{2}$ cwt., and can climb almost anything. The back tyre is 28 by 2, and I am changing it for a 28 by $2\frac{1}{2}$.

Which tyre would you recommend, a rubber-studded or steel-studded one, and would either slow car much?—G.W.H.

All things considered, a 28 by $2\frac{1}{2}$ in. rubber-studded cover will suit you better than a steel-studded one, as it will slow the machine less and will not slip on granite setts or grease. A steel-studded cover, while perfectly satisfactory on greasy roads, has a tendency to slip on dry stone setts.

Respecting a Light Forecar.

Q.

(1.) What would be the best horse-power for forecar work? (2.) Would a $3\frac{1}{2}$ h.p. Brown (new) overheat with forecar? (3.) Which ignition would be

the better for forecar work, magneto or accumulator?—F.E.

(1.) It all depends upon the combined weight of the passengers and the district in which the machine is to be used. (2.) If the hills are not steep, and the high gear is fairly low, say $5\frac{1}{4}$ to 1, it is possible to manage all right with a single-cylinder $3\frac{1}{2}$ h.p. engine and two-speed gear. If the hills are steep, and it is your intention to use the machine during the winter months on heavy roads and against headwinds, we should recommend a twin-cylinder engine of about 5 h.p. If the engine is in perfect order and well lubricated there is no reason whatever why it should overheat. (3.) Magneto ignition if price is not a consideration.

Unequal Firing in Two Cylinders.

Q.

I have a Rex twin-cylinder motor cycle and cannot get it to fire evenly, the front cylinder always firing the fastest.

I put the advance lever two-thirds on, and it makes the front cylinder fire at the top of stroke and the back half-way down. I have worked the contact points all ways and altered other things.—S.S.

Is your machine fitted with magneto ignition or battery and coil? If the former you have perhaps got one of the old pattern Bosch magnetos. The latest pattern has the terminals one on each

side of the end plate on the driving side at equal distances. That is to say, on your machine one contact would point forward towards the front mudguard and one contact backward towards the back mudguard in an exactly horizontal position. Apart from the timing of the spark, remember that to get even running in both cylinders the compression must be equal, inlet and exhaust valve springs same tension, and valves the same opening in each cylinder.

The Weight and Size of Flywheels.

Q.

(1.) Does a motor cycle with a given size single cylinder engine take a hill with a given gradient better if built with large flywheels than the same given engine built with small flywheels, both geared for reasonable touring work? (2.) I note on most racing motor cycles that weight is reduced wherever possible, but seldom do we see the heavy flywheels reduced in weight, or is it that they are drilled? (3.) Would it be correct to think an engine fitted with heavy

flywheels would produce more power than one with small ones?—W.F.W.

(1.) The question of the size and weight of flywheels is a matter dependent upon the ratio of compression and other points in the design of the engine. Speaking broadly, large flywheels assist in hill-climbing, provided they are not so large and heavy that the weight to be carried is in excess of the benefit derived from the momentum gained from the flywheels. Other things being equal, a low-geared machine with high speed engine does not require such large flywheels as one geared higher and fitted with a slower running engine. (2.) Weight cannot be removed from the flywheels in a racing machine without reducing the efficiency of the engine, provided the flywheels are first of all designed of a suitable weight and size for that engine. The flywheels are never drilled unless the moving parts are not correctly balanced, then sometimes they are drilled to reduce the weight in one portion of the diameter. (3.) No, because the flywheels might be too heavy.

All classes of motors were engaged in connection with the election of city councillors at Liverpool. Assisting one candidate was a Rex motor bicycle and sidecar and a dog with "Vote for Jackson" on its coat.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Dome Top Pistons.

[3669.]—I read "Ixion's" very interesting comment on "Domed Pistons" in the issue of October 28th, but I fail to see how the domed piston can be called a new idea. Many years ago I bought an engine that was fitted with a domed piston. The makers were the Norfolk Engineering Company.

For the benefit of your readers I have made the experiment of trying a domed piston and a flat piston, and I can truly say that a domed piston is just as likely to collect deposits as a flat one. I found at the end of 1,000 miles equally as much carbon deposit on the domed piston as on the flat one. I rode the machine myself—in fact, it has never left my hands. I rode under similar circumstances and used the same brand of oil, viz., Price's; also same quantity per 1,000. My machine is a 1908 model, and a very good make. Whatever the chemical analysis of deposit may be, the cause of it adhering to the piston top is obviously oil.

A READER.

Are You in the Trade?

[3670.]—Now that the Stanley Show is near at hand, it would doubtless be most satisfactory for every motor cyclist to receive a courteous and explanatory reply to any questions he may ask of representatives of exhibitors, instead of, as in most cases, being met with that familiar phrase, "Are you in the trade?"

Motor cyclists in most cases, I believe, attend the show to select the best in their opinion (as far as means will allow) for future requirements, and gather what information they can regarding the general mechanism, which not only helps them to arrive at a decision, but keeps them enthusiastic.

I have found our foreign competitors obliging in every way, and any suggestion is not only appreciated, but looked for. They evidently adopt this policy to improve their position in the English market with success, while many of our own manufacturers scorn the very idea.

Let our exhibitors place competent representatives in charge of their productions, with instructions not only to reply to trade enquiries, but cater for the much belittled motor cyclist.

W.E.G.

Hill-climbing.

[3671.]—In reply to Mr. Hart-Davies [letter No. 3637], I regret he should think I doubt his performance, as such is not the case. It is the hill I doubt. To clear up any misunderstanding I might state Beggar's Roost and Barbrook are two distinct hills at least a mile apart. Beggar's Roost is the first hill on the road from Watersmeet to Lynton by the road over the hills, and Barbrook is on a turning on the left of the Lynton to Parracombe Road, about a mile or so from Lynton. The gradient of Beggar's Roost is 1 in 5.3 at the steepest point, and Barbrook about 1 in 3.7, as near as I could measure it. I have found measuring gradients of less than 1 in 4 there is always risk of error, in consequence of roughness of surface. Even Mr. Lafone, who Mr. Hart-Davies gives as his authority, is not correct in that Beggar's Roost is at least a mile from the Barnstable to Lynton Road, and could not be included excepting by a detour of some miles. I sincerely hope Mr. Hart-Davies will not think I doubt his word, but my only desire is to correct such errors as must be obvious to anyone possessed of a good map of the district.

HAROLD KARSLAKE.

[With the object of clearing up this question, we forwarded a copy of Mr. Karslake's letter to Mr. Hart-Davies, whose reply with a sketch map we are publishing simultaneously in the next column.—Ed.]

[3672.]—It is quite possible that Mr. Karslake and I are confounding two hills. The one which I have referred to as Beggar's Roost is situated a mile out from Lynmouth, on the left of the road to Ilfracombe. This is the hill which Mr. Karslake refers to as Barbrook Mill Hill.

I understood from the local people that this hill was called Beggar's Roost, but I am quite willing to be guided by Mr. Karslake's knowledge in the matter. The schoolmaster at Barbrook assured us that the hill was called Beggar's Roost, and sometimes Riddaway Hill or Barbrook Mill Hill. Mr. Karslake's

letter in this issue describes the hill and its situation very clearly, and I need only add that the hill I climbed was the one with the steepest gradient.

IVAN B. HART-DAVIES.

[We have examined a contour of the hill which Mr. Hart-Davies climbed, prepared by a surveyor, and find the steepest gradient is 1 in 3.6.—Ed.]

X marks the hill climbed by Mr. Hart-Davies.

Tandem Motor Bicycles.

[3673.]—I am glad to see that a correspondent has been giving his very favourable experiences with a tandem motor bicycle, and having solely used this type of machine for six years, over a distance of 16,000 miles, thoroughly agree with him, but should like to point out that, although the tandem is much less liable to side-slip than a single, I think most motor cyclists will agree that no single track machine can be absolutely proof against it.

The remedy is, avoid towns; and used as a country machine the tandem is a combination difficult to beat, either for comfort, speed, hill-climbing, or economy. For a specification, personally, I am tired of lugging a heavy machine about, although my machine is considerably lighter than some of the 250 lbs. bicycles. I suggest a light twin, about $3\frac{1}{2}$ h.p. (one that will run smoothly at high speed), either geared low, or, if you can get such a thing, a really light two-speed gear, modern type, very low frame, spring forks (these are an improvement, but even without them a tandem will beat a single hollow for easy running). Pedals are a great convenience, but if used much on a long ride one is apt to get saddle sore. Above all, aim at making a light machine. Two inch tyres will be quite sufficient.

J. L. PITCHER.

A Problem to be Solved.

[3674.]—In answer to letter No. 3648, I do not agree with Mr. Ovington in regard to his solution of the problem of the abnormal condition of F.N.

He seems to think that it is caused by the speed of the engine reaching the point when there is no leakage of gases past the piston or valves, so that the engine gets every benefit of explosion, and that this causes abnormal speed. This does not coincide with other letters in other issues of your valued paper *re* greater speed on slightly lifting the exhaust valve, and my theory is quite different from the above solution.

Now when the engine is running at a moderately high speed, the inlet valves are sucked open with a bang, and recoil on to their seatings at the end of the suction stroke

with several bounces or vibrations, sometimes called chattering. If this is bad it causes blowing back into the carburetter, which is detrimental to fast running. The chattering can be distinctly heard in some engines when going at a fast speed, but in the abnormal condition one cannot hear it, nor does it occur, as the engine has picked up enough speed for the engine revolutions to synchronise with the vibrations of the inlets, which all work together as if they were mechanically operated. This, I think, is the reason of the abnormal results.

Now the question of slightly lifting the exhaust valve lifter to give greater speed when running fast is a well-known fact, and the reason for same is that it stops the chattering of the valve on its seat. If chattering occurs, it allows the piston to suck some exhaust gases back at the same time that it sucks gas through the inlet valve. Slight raising of the lifter stops this, and the engine runs faster in consequence.

RYDER.

Improving the Twin Engine.

[3675].—"M.O.I.V.'s" remarks on "Twin Engine Improvements" are very true, and it was on the question of bearings and their size that some of us advocated forged crankshafts and outside flywheels, so that a really long adjustable big-end bearing could be used. I think a better plan of arranging these on one shaft in a twin engine is to have the plain connecting rod taking a bearing on the outside of the bush of the forked rod, and this can be done by using a bronze bush on the latter and a case-hardened steel one on the former. This obviates having to use two separate bushes in the forked rod. I would also suggest half compression on all large twin engines, so that the engine will fire at a walking pace; not many engines will do this.

I think, like "M.O.I.V.," that mechanically-operated inlet valves on twin and four-cylinder engines are a *sine qua non*, but I do not share his opinion with regard to the use of automatic valves on single-cylinder engines. The J.A.P. people still use them, and get wonderful results with them, and as for cars, I see the 8 h.p. De Dion engine with automatic inlet valve is being retained for 1909. For single-cylinder, high-speed engines I believe the automatic valve the better, as it opens in response to the pressure existing in the cylinder, and not like the mechanical valve, at a moment when the pressure may be above atmospheric, thus causing a rush of exhaust gas into the carburetter, which has to be drawn back with the fresh charge; at high speeds this effect must be fairly considerable.

Naturally, at low engine speeds the mechanical valve has the pull, but motor cycle engines are not slow-running engines.

With reference to Mr. Earle Ovington's letter, it is, I believe, a fact that was discovered many years ago that a bad compression is more noticeable at low speeds than at high, and that an engine with good compression (not high compression) will plug away uphill better than one with bad. It stands to reason that this will be so. G. D. MONICE.

The Handicapping of Motor Cycle Races.

[3676].—It was not my intention to go further into the above subject, but I think the letter of "Five Horse-power" in last week's issue calls for answer, inasmuch as the statements therein are anything but facts. Who the gentleman is, I can only surmise, as I note he does not care about signing his name. In the first place, he states that "the 5 h.p. was not 5, but 3½ h.p." It would be interesting to know why it was entered as 5 h.p., and why the makers call it a 5-6 h.p., if it is only 3½ h.p. I presume that your correspondent takes into consideration, when working out the h.p. of four cylinders, the fact that there are four working strokes in the four cycles—a most important factor. He also states that "the 5 h.p. was double the weight of mine, and that the rider was three stones heavier than myself." If this is so, then he weighed thirteen stones, and his machine weighed 300 lbs.!

As regards my machine being a converted racer, I fail to see what this has to do with it, as long as it conforms with the rules and its weight is stated on the entry form. I consider 150 lbs. a very reasonable weight for a 2½ h.p. machine—in fact, too heavy. As regards his remarks about my performances at Canning Town, I can only say I think they are bad taste, especially as he writes under a *nom de plume*, and I should like to point out that my letter was not in reference to my own personal ability, but upon the

present system of handicapping motor cycle races. If his statement "that my name very rarely appeared in the winning list" has any truth in it, one wonders all the more why I, riding a 2½ h.p. machine, am put on level terms with a 5 h.p. at the Stadium, and when riding a 4½ h.p. give the same machine nearly a mile start in five at Brooklands.

W. W. GENN.

Magneto Manufacture.

[3677].—We read with interest among your "Letters to the Editor" the one concerning magneto manufacture, and we think a little explanation is needed in this case.

Mr. Jackson is evidently not aware of the difficulties surrounding the manufacture of an all-British magneto, and while we will not go so far as to say that there is not such a thing, we do emphatically state that the difficulties in producing an all-British magneto are colossal.

1. First of all there is but a limited demand for magnetos.
2. The Bosch Magneto Co. is in a position to fill that demand.

3. The machines we produce are international, inasmuch as the best material in every detail is obtained from various parts of the world, but it is true the whole of the work and assembling is done at Mr. Bosch's works in Stuttgart.

4. The demand being supplied by such a reliable machine as that sold by us makes it unnecessary for motor cycle or motor car manufacturers to experiment with machines of unknown qualities, more especially with the trade in its present state, that is to say without a farthing to waste on unnecessary experiments.

5. Many attempts have been made to manufacture magnetos in England, but they have only been more or less successful on account of lack of enterprise.

It may further be interesting to your readers to know that if necessary we are in a position to supply magnetos of British manufacture; but as this company has insufficient facilities for manufacturing large quantities of machines in this country, they are at the present moment more expensive than the machines of German manufacture, and we would point out that though Englishmen in the main are extremely patriotic, they will not, as a rule, sacrifice money for the upkeep of sentiment.

With regard to the editorial paragraph at the bottom of Mr. Jackson's letter, the writer who has been for more than sixteen years connected with the largest electrical manufacturing concerns, is in a position to assert that the standard of work at present being carried out in our largest electrical works is far too inferior to meet the requirements of magneto manufacture for ignition purposes, and we would in conclusion point out that to produce the machines that are being at present sold by the Bosch Magneto Co. special machines and tools have had to be made, and as these have had to be built in the factory in which they are used they are not available for the use of competitive manufacturers.

For THE BOSCH MAGNETO CO., LTD.,

ARTHUR E. BENNETT.

SUMMARY OF CORRESPONDENCE.

W. Grant writes: "Replying to the letter [3626] of W. Raymond Crawshay, I believe the A.V. magneto plug, marketed by Searle and Co., 33, Glasshouse Street, London, W., would meet his requirements. It would be advisable in ordering to mention that his engine has a high compression."

EXPERIENCES WANTED

P. G. W. (Surrey) would like users' experiences with Elastes tyre filling.

Trebles the life of the Pulleys.

WHAT MANY OF OUR CUSTOMERS SAY:

“Have had belt in use for over three years.”

“Done upwards of 20,000 miles.”

“The only belt for heavy passenger work.”

“Five times cheaper than any other.”

“The poor man's belt.”

“No sign of slip.”

“The ‘no trouble’ belt.”

“Have not taken belt off pulleys for two years.”

“The best belt on the market.”

STAND 58,
YOU **STANLEY SHOW,**
CAN BE
A MOTOR
CYCLIST.

FULLY REPRESENTS
THIS MACHINE
AND ITS MANY
VIRTUES.

“Yes, but the price,” you say,
with visions of £50 or more to be expended. No, this is just the idea we are anxious
to dispel. We have definitely proved that it is possible to build a really efficient
motor cycle, capable of high speed and hill climbing, at less than one-third
of this price. The “WOLF,” which, although weighing only 60 lbs., is as
perfect in every respect as a higher priced machine, and costs what
is practically the cost of

a high-grade cycle—
£19 19 0.

THE “WOLF”

THE TYRE FOR WINTER RIDING.

Model A Motor Cycle Tyre.

**THE ONLY NON-SKID WITH
A SMOOTH RUBBER TREAD.**

The Non-skid lasts as long as the tread.

TESTIMONIAL.

“I am delighted with my covers; the back has run about 1,000 miles, and has scarcely been marked, some hundred miles of which has been with an extra passenger on the carrier. The machine in riding trim weighs 225lbs., myself 12 stone, and passengers from 10 to 12 stone.”

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London (20, Tudor Street, E.C.), by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

THE NEW PREMIER HORNS.

BINOTE. TRINOTE. BETTER THAN THE ORDINARY HORN,
because their sound carries twice as far and is less offensive—more musical.

You will not realise how superior these are to the old type of horn until you have handled one. Send us remittance 7/6 or 10/- and we will send one on **THREE DAYS' APPROVAL**, returning your money at once if you send it back for any reason whatsoever

7/6. 10/-.

ANTOINE CYLINDERS, PISTONS, and all other SPARE PARTS we can supply promptly. WRITE NOW. SAVE TIME AND MONEY.

WRITE FOR **LISTS OF ACCESSORIES.**
PREMIER MOTOR CO., LTD.
Aston Road, BIRMINGHAM.
Telephone 4,310. Telegrams: "Primus, B'ham."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20 Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Little and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard this silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

CONTACTS.

COPY of Letter from **Mr. C. R. Collier**, "Jebron." Dear Sir.—You will be interested to learn that your "Jebron" contacts were fitted to the 7 h.p. "Matchless" motor cycle on which I recently broke the world's hour record, covering 70 miles 1 yard. The wonderful regularity of the running of my engine was, I consider largely due to the excellence of your contacts, which are not to be compared in reliability with platinum. I did not experience a solitary misfire, although for some time my machine touched 73 miles an hour. Wishing you every success with a splendid article, which I have tried with equal success on magnetos, yours faithfully, **C. R. Collier**.

JEBRON Contacts were used by **Mr. C. R. Collier** on his Matchless motor cycle when making the 1 hour world's record Brooklands, October 8th, 70 miles 105 yards. **Jebron** for high speeds, cures misfiring.

JEBRON Contacts, registered 291-289, vast superior to platinum; cures misfiring; is reliability and efficiency.

JEBRON, best contact obtainable for blades, screws, cranks, rockers, plungers, magnetos, coils.

JEBRON, prices 2s. 6d. each rivet fitted special trimmers for polishing Jebron 9d.; remittance with order ensures prompt attention; write for particulars and testimonials; too numerous to publish.

JEBRON, Magneto Screws, complete for Bosch magneto, DA2 and DAV, will contact breakers 5a, 5b, 5c; 5s. 6d. pair; screws refitted with Jebron, 2s. 6d. each equal to new.

JEBRON, the King of Contacts, fitted promptly return post; no delay; post free home or abroad; liberal trade terms.

JEBRON.—From the Inventor, **J. Edward Brown**, 38, Herbert Road, Plumstead, Kent.

IRIDIUM Champion Contacts.—Any pair fitted, returned same day, 1s. 3d. each warranted pure; special iridium trimmer 9d.; no filing required; magneto screws refitted, 1s. 3d. each.—**Williams**, 16, Wellington Street, Woolwich.

ENGINES.

23 h.p. Genuine De Dion Engine, near new, only wants contact; 90s.—**A. Beehive**, Meeting House Lane, Peckham.

ENGINES, Engines, Engines, bought, sold or exchanged; new $4\frac{1}{2}$ h.p. twin, £6 10s.; new $3\frac{1}{2}$ h.p. M.O.V., £6 10s.; approval.—**Motor Accessories**, Broad Street, Coventry.

ENGINES, Engines, Engines.—Large stock of clearance lines in new and second hand engines from 1 h.p.; send for particulars.—**Motor Accessories**, Broad Street, Coventry.

6-7 h.p. Twin Jap Engine, complete, and fitted in No. 7 Chater-Lea frame, 13s.; $3\frac{1}{2}$ h.p. Fafnir engine, with carburettor etc., £4 19s.; all quite new.—**6, Killearn Place**, Catford.

4-5 h.p. Simms Engine, M.O.V., water-cooled quite new, £7 10s.; $3\frac{1}{2}$ h.p. Standard engine, £4 10s.; 23 h.p. Quadrant, £3 3s.; h.p. Antoine, with damaged cylinder, 15s.; 23 h.p. Quadrant engine sets, 25s. set to clear.—**Below**.

31 h.p. Quadrant Engine Sets, comprising cylinder, piston, connecting rod, crank cases, flywheels, three bushes, etc., £2 19s. each.—**Farrar**, Square Road, Halifax.

BOOTH.—New 6 h.p. twin Antoine, £8 15s.; 3 h.p. Simms, magneto, M.O.V., £5 10s.; water-cooled 5 h.p. Antoine, M.O.V., new, 5s.; 5 h.p. Aster, w.c., £7 10s. — **Booth Motories**, Wade Street, Halifax.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

Show Features.

THE show which was opened on Friday last at the Agricultural Hall, Islington, N., by Sir Albert Rollit is the 5th exhibition which has been held by the Stanley Committee since the first number of *The Motor Cycle* was published. This year's display of motor cycles and accessories is quite as large as before, and the number of exhibitors is increased by the addition of several large and reputable firms, whose machines when they get into the hands of the public will tend to still further increase the popularity of the pastime. The motor bicycle, although far removed from finality in design, is settling down to a standard model—at least so far as the older makers are concerned. There are a few radical departures which can only prove their true worth by actual public performances, and time alone will show their value.

As already forecasted, handle-bar control and magneto ignition are universal, as also are spring forks. The frames are slightly lower, and there is a slight tendency to build the frame with a specially low top tube and carry the socket tube higher, supporting it by lugs built into the fore part of the diamond. Very few machines are shown without stands and luggage carriers, the former in nearly all cases allowing the rear wheel to be detached without interfering with the stand attachments.

On machines of 3 h.p. and over there is a greater tendency to dispense with pedals and fit in their place a neat pair of footboards. The change speed gear is also steadily gaining ground, the live axle rear hub type most certainly predominating. Although other systems hold their ground, they have not advanced at the same rate.

The twin-cylinder lightweight is increasing in popularity, and several new examples are on exhibition, the method of transmission having been greatly improved. There are three types to choose from—twin V, horizontal opposed, and vertical. The single-cylinder lightweight remains practically unaltered. For passenger work the powerful twin-cylindered machine with two-speed gear is shown attached in most cases to a sidecar, although there are examples of the air-cooled forecar built as a non-convertible machine on the lines advocated in these pages. The two examples of four-wheeled runabouts built on motor cycle lines, viz., with air-cooled engines and combined belt and chain transmission, should not be missed by motor cyclists. They are in the Gilbey Hall to the right of the main entrance to the hall, and, like the galleries, may easily be overlooked by those who only have a limited time in which to inspect the exhibition. It is in the galleries that many of the interesting accessory exhibits will be found. A great deal of ingenuity is yearly devoted to the improvement of such articles as touring bags, saddles, ignition devices, belt fasteners, lamps, adjustable pulleys, etc. All the principal improvements in this direction will be found in our description of the exhibits. The number and variety of these accessories, however, make it impossible to include opinions concerning their merits in this article, which deals with main tendencies alone. One of the growing tendencies is the adoption of strong and efficient speed indicators for motor cycles. These instruments require to be well and carefully constructed; motor cyclists must therefore expect to pay a reasonable price for them, as a cheaply made article seldom indicates accurately. The exhibition, which closes on Saturday next at 10 p.m., should be visited by all motor cyclists who can conveniently attend.

Occasional Comments

By Fiction

A Smart Accessory.

1908 has produced several of those rare phenomena accessories which are all but indispensable to every motor cyclist. Among them the combined inner tube and spare belt carriers take a high rank, but in the very first place I think should rank the Lumsden sparking plug tester, described and illustrated on page 858. For some years I have used a bolted on bracket to grip the plug and provide an "earth" for the high-tension current during all sparking plug tests, but the Lumsden is a great improvement on my rough idea.

Domed Pistons.

An Ulverston correspondent kindly reminds me that the Brown motor bicycle engine was turned out for at least twelve months with a convexly domed piston. He further states that, in his opinion, this design of piston throws a lot of work on the top piston ring by directing the force of the explosion towards the cylinder walls, and thence down upon the rings. One would certainly imagine that of the two types of domed piston the concave pattern would be the most efficient, provided always it did not serve as a collecting bowl for accumulations of carbonised deposits; but I doubt whether the convex pattern can put more of a burden on the top ring than it already has to bear.

The Future of Variable Gears.

Without doubt the development of variable gears has been greatly hindered by the production of sound adjustable pulleys, as riders who had previously been clamouring for a variable gear of the saddle-operated, several-fixed-ratio type have found their main needs more or less satisfied by adjustable pulleys. On the other hand, the almost universal adoption of these makeshift substitutes for a proper two or three-speed gear has taught riders the advantages of a multi-speed gear, and thus they have been educated up to the appreciation of variable gears, and will be more ready to adopt them when improved patterns finally enter the market. At the Stanley Show (now open) there are several new and interesting exhibits in this line, and I am strongly of opinion that within five years from date the standard high-grade motor bicycle will possess a change speed gear and free engine. I shall, further, not be surprised if this development also brings in its train an entirely enclosed and weather-proof transmission, including a spring drive. Great advances have been made in belt design and construction during the last five years, but no one can claim that it is perfect, or indeed ever will be, since it cannot be made weather-proof. Owing to its cheapness, light weight, and facility of repair, it must always survive on cheaper mounts, but I for one believe it will eventually be superseded on the higher grade machines.

Handle-bar Control.

I think I have now tried every brand of handle-bar control on the market, and I cannot help feeling that no patentee has yet quite hit upon the natural finger action. All of them will do very well on the supposition that one is going to wholly or partially relax the grip of one hand while setting the levers. But no rider can retain a good grip and at the same time wave his forefinger horizontally, as most patterns of H.B. control demand, nor yet work two stumpy levers, working out radially from either side of the bar. For real comfort and convenience, and also for real safety at speed, the levers ought to be of the pull-up type, set like a brake lever beneath one of the grips; they could easily be pushed down, as well as pulled up, by the tip of the finger, without relaxing the grip, and I rather fancy a control of this type will eventually come to the front. At low speeds it matters little what type of control be employed, but at high speeds, such as most machines of to-day can attain, the grip must be permanently good. If a machine is allowed to swing ever so slightly at high speed a novice is not likely to regain control before the machine has wobbled over.

Two-speed Lightweights.

I have received several enquiries for a two-speed gear suited to 80 lbs. motor bicycles. These enquiries have come from riders of poor physique resident in exceptionally hilly districts. I have been compelled to reply that I know of no suitable gear, all standard gears being disqualified either by their own weight or by the lightness of the frame and fittings of the cycle in question. Here is a gap that might easily be filled. A very light hub gear indeed would be strong enough to withstand the gentle impulses of a 2 h.p. twin-cylinder engine, *e.g.*, the Moto-Rêve. Such a gear would be a desirable fitment on all the members of the 80 lb. class, as it would increase the hill-climbing capacity and reduce the frequency of belt troubles. All fixed gear machines are geared lower than is necessary for four-fifths of their running, because exceptional hills are kept in view. This low gear ratio is essential in the absence of a variable gear, but on most lightweights the miniature engine pulley thus rendered necessary produces frequent and exasperating belt troubles. Could not a hub gear be devised which would not add more than a few pounds to the weight of the machine, and which would in addition reduce belt troubles by rendering a bigger front pulley possible, and simultaneously double the hill-climbing capacity? I have used a light gear made by the Hub Two-speed Gear Co., which weighed very little, and stood up all right on a 3 h.p. 130 lbs. single-cylinder roadster, but I do not know if it is still on the market. [It is not now sold for motor cycles.—Ed.]

An All-British Magneto.

WE have received for inspection a new motor cycle magneto of the high-tension type, the product of the Premier Accumulator Co., Ltd., Northampton. Although only recently placed on the market, we understand that the magneto has undergone severe tests during the last twelve

Showing the brass bed plate A, and iron pole pieces B, which are all made in one solid piece in the casting process.

months, and is being tested with a view to adoption by several well-known manufacturers. There are several original points about this magneto, such as the case for enclosing the armature, the brass case and the iron pole pieces being cast together. The make and break of the contact breaker is novel, and can be removed from the

machine in a few seconds and examined while lying in the palm of the hand. Adjustment is provided for the usual fixed platinum point, as shown in the drawing of the contact breaker, so that wear can easily be taken up. Another good point is that the end of the bell crank rubbing on the cam has a

The Premier All-British Motor Cycle Magneto, showing contact breaker and armature removed.

case-hardened steel ball threequarter-sunk into it, and is operated by a steel cam, thus ensuring long life for these particular parts, which are so vital in the running of the engine. The armature is totally enclosed, and is claimed to be damp-proof.

The construction of the magneto is most simple and accessible, and, if necessary, it can be taken to pieces in a few minutes. First of all the vibration-proof contact breaker cover is removed, and inside the cover the contact breaking mechanism is held by a couple of nuts. After unscrewing the high-tension carbon brush the entire armature can be withdrawn, complete with its Hoffmann ball bearings, slip ring, and circular condenser; this is attained by making the bearing cases a good fit in two circular recesses in the

main casting. It will thus be seen that the magneto consists essentially of three separate units, viz., (1) the magnets, with which is the armature casing, (2) the armature, complete with bearings, slip ring, and circular condenser, and (3) the contact breaker, complete with cover.

These parts are shown detached in the half-tone illustration. A spark gap is provided by the method of construction. The brass insert in the high-tension collector ring is only $\frac{5}{16}$ in. distant from the brass armature case for the whole of its circumference, so that if a high-tension plug wire becomes accidentally detached the current will here find an easy path to earth.

For V-type engines the armature box is

constructed as a single casting in exactly the same way, but with shaped and staggered pole pieces.

The magneto gives a spark at very slow speeds, ensuring easy starting.

It is exhibited on Stand No. 19 at the Stanley Show.

The contact breaker fastened inside the end cover, showing platinum contacts, flat spring, and rolling ball actuating the contact making arm.

ANOTHER ADJUSTABLE PULLEY.

THE adjustable pulley shown in the annexed illustration is one sent to us by Mr. G. R. Lee, 18, Somerset Road, Edmonton, N. It is very simply constructed, consisting merely of the

fixed and the loose flange, the latter being screwed on to the boss of the fixed flange. The loose flange is screwed on, and to lock it in any desired position there are semi-circular grooves machined in the boss which coincide with similar grooves cut in the loose flange. When two of the semi-circular grooves are in register a pin is inserted which is screwed into the back of the fixed flange, so holding the loose one from turning. The advantages claimed for it are extreme simplicity, a fine adjustment, and no loose parts to rattle. It is said to be unnecessary to remove the belt when making the required adjustment.

In the illustration the screw head is shown partly protruding. When the pulley is in use it is flush with the outer edge of the boss. The second hole for the screw is to allow for a finer adjustment, viz., one-third turn of the loose flange. We are assured that the article has been well tested in actual service on the road.

THE NEXT ISSUE will be the third and last of

"THE MOTOR CYCLE" SHOW SPECIALS

and will include special articles on the exhibits

Questions and Replies

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E. C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

A Damaged Accumulator.

? I have just had an accumulator recharged, and now it is returned with the positive plates crumbled and the celluloid case buckled. Would this be done by charging too fast or only by a fall?—J.A.G.

The trouble is probably due to the accumulator having been charged too rapidly. There is nothing to be done except to send it back to the makers to be repaired.

An All-weather Machine.

? I am going to buy a $3\frac{1}{2}$ h.p. P. and M. motor bicycle. As I wish sometimes to take a passenger I prefer to have three wheels at night and in grease. Would you advise a forecar attachment or a side-carriage? Oftenest used without passenger. Roads narrow, hilly, rough, and stony. Combined weight of self and passenger twenty-five stones. Will the machine be strong enough for this work?—Dr. N., South Wales.

A forecar attachment would be satisfactory, and it would be better if sprung in front, and the passenger's seat made easily detachable. The machine should be quite strong enough for your work if not driven too fast over rough roads.

Knocking in Engine when Picking Up Speed.

? I have just fitted new piston rings and new connecting rod to my $3\frac{1}{2}$ h.p. magneto Rex. Previous to this I had never had any reason to complain about knocking in the engine, but now when starting with the spark fully advanced there is serious knocking until the machine picks up speed, and on the least hill this same thing occurs. I may say, however, that the pounding is very much more noticeable when running against the wind, but so long as I can keep up a speed of fifteen to twenty miles per hour everything is A1. I have previously always run with the spark fully advanced, and I scarcely ever move the lever. Could you help me in the matter?—H.C., Wilts.

It is just possible that the connecting rod may be slightly longer than previously, thus reducing the compression space, or the new piston rings are too tight a fit. The engine may also have been timed differently, and requires the spark lever slightly retarded until the engine has picked up speed. You could try reducing the compression by inserting a washer between the bottom of the cylinder and the top of the crankcase if you find the knocking is not due to the timing or the new rings.

Speedometers.

? Do you think a Bullard speedometer can be fixed to a $3\frac{1}{2}$ h.p. 1908 Triumph motor cycle? I have had a Goodlad, but it would not work on account of the spring forks.—C.W.S., Manchester.

We understand that the Bullard speedometer will fit your machine. You could make the Goodlad work on your machine all right by fitting a longer flexible shaft and driving by the rear tyre.

A Reader's Experience and Warning.

? I should be glad of your advice (or that of your readers) in regard to a claim for personal damages I have had to pay through my running a man down. Three weeks after the accident I got a letter from him demanding £10 damages, as he had not been able to work since, and his wage was £2 per week, and he had eleven children to support. My solicitor advised me to pay, which I did. I now find the man had only been off work two or three days, and five or six of his children are working. Can I bring any action against him for making a false claim, or would you let matters stand as they are? In any case, I think you should warn motor cyclists not to part with their money without fully investigating any claim that may be brought against them.—VICTIM.

We fear that as you have paid the claim you can do nothing. This is, of course, an entirely legal question, and one which you should ask of a solicitor. However, we are practically certain that you had better leave the matter now as it is. Thanks for the warning.

Explosions in the Silencer.

? I recently bought a $3\frac{1}{2}$ h.p. Minerva bicycle, and it is in good trim with one exception, that is, explosions in the silencer, when I cut out the lift the exhaust lifter, more especially if going at slow speed, and very bad if magneto is fully retarded. There is a sharp pistol-like crack when exhaust is dropped again, and also when switch is put on. In the dark the explosion shows like a yard of flame coming out of silencer, and the noise is enough to frighten a horse. Please tell me what is wrong and how to remedy the matter?—C.C.

Explosions in the silencer are caused by charges of unexploded gas which have collected therein, while the exhaust has been raised or spark cut out before fired by the first flame which enters the silencer from the exhaust. The way to prevent them is to have the throttle practically closed when using cut-out or valve lifter. It is unusual to drive a magneto ignited machine with ignition lever fully retarded; try to drive more on the throttle.

Enthusiastic Vindec Special riders in Tasmania. From left to right—A. Bosworth, Rev. H. B. Atkinson, Cecil M. Dyer, and S. Spurling, jun. Some of Mr. Dyer's interesting adventures while motor cycling in Tasmania were related on page 846 of *The Motor Cycle* for October 28th, 1908.

MOTOR
CYCLES& ACCES-
SORIES

The following illustrated description of the motor cycles and accessories at the Agricultural Hall Show has been written by *The Motor Cycle* staff after a careful examination of the exhibits. The report is arranged alphabetically, and stand numbers are given, so that with the aid of the plans in our last week's issue, readers will have no difficulty in finding the whole of the exhibits of interest to motor cyclists. The exhibition closes on Saturday next, 28th inst., at 10 p.m.

Alldays, No. 131.

The Alldays is one of the entirely new model motor bicycles at the show, and is a medium weight machine of 2½ h.p. The engine is carried low down in the frame, and is fitted with an automatic inlet valve. The cylinder has two long holding down bolts extending to the top of the combustion head. A handle-bar controlled Amac carburetter is fitted and a Bosch lightweight magneto. The petrol tank is a

Alldays & Onions new pattern medium weight motor bicycle.

round one. Although no spring forks are fitted, the handle-bars are pivoted at the top, and their movement is controlled by a coil spring. The machine has a front rim brake and a back pedalling belt rim brake. The rear mudguard is made detachable for ease in tyre repairs. A Rideasy saddle, tubular carrier and stand, and pedalling gear complete the equipment.

Ariel, No. 232 Gallery.

The 2½ h.p. Ariel lightweight motor bicycle has been improved in several respects. It is now fitted with the latest pattern Brown and Barlow handle-bar controlled carburetter and a specially large sized toolbag behind the petrol tank. This space was previously occupied by accumulators and coil, but now that magneto ignition has been adopted the special tool case fits snugly. The Ariel lightweight is a fast machine for its power, and a splendid little hill-climber.

Arno, No. 301 Gilbey Hall.

This company exhibit for the first time at any show the Arno single-cylinder motor bicycle. The frame is built specially low, with long straight chain stays extending direct from crank chamber to rear forks, with the exception of the one crank for the belt rim. The bracket for pedal axle is detachable to enable riders who prefer a pedalless machine to remove the pedal gear entirely and leave no trace of it having been fitted. The ball socket is a particularly strong piece of work, and, although the frame is very low, the length of the steering socket is not reduced in any way. Spring forks are provided, and the forks are also stayed with girder tubes. The engine (which is made throughout at the Arno

Motor Co.'s Coventry works) has a bore of 90 mm. and a stroke of 85 mm., with Hoffmann ball bearings to the crank shaft. The silencer consists of a separate casting, which fits over the exhaust tube, the latter being drilled with a number of fine holes, the final exhaust release taking place underneath the outer casting, and somewhat to the left-hand side. The ignition is by a Bosch chain-driven magneto machine, the magneto being fitted behind the engine on a bedplate cast with the rear half of the cradle. The carburetter is an Amac with handle-bar control. Neat metal footrests are fitted, with the name Arno embossed upon them, the raised lettering giving a good grip to the sole of the boot. Mr. Hammon, who is responsible for the design and production of this machine, was also the maker of the Clarendon motor bicycles, a number of which are still running and giving every satisfaction to their owners.

Bat, No. 97.

No less than seven distinct models of the well-known Bat motor bicycles are to be seen here. Beginning with the smallest, the 2½ h.p. lightweight is a machine worthy of special attention. It embodies the well-known Bat specialities, such as their spring frame and spring forks, and is fitted with the new lightweight J.A.P. engine, having a bore and stroke of 70 by 76. The ignition is by Bosch magneto, type DA1, gear driven, all the gear wheels being enclosed in a case forming part of the timing gear cover. The carburetter is the well-known Amac with handle-bar control. Another interesting type of machine which should be very popular during the

The Bat Four-wheeler, propelled by a 9 h.p. twin-cylinder engine through a change-speed gear. Both back wheels are differentially driven.

Motor Cycles at the Stanley Show.—

coming year is the $3\frac{1}{2}$ h.p., 85 by 85, with the new J.A.P. engine with side by side valves. The ignition is by Bosch magneto carried in a compartment of the tank, and driven by means of a vertical shaft and bevel gearing. The usual Bat spring frame and forks are fitted. The 6-7 h.p. twin with automatic inlet valves has been previously described in these pages, and remains unaltered for 1909. A lighter type of the above machine is also shown, in which the springing arrangement has been slightly modified, enabling the frame to be

4 h.p. 1909 Bat, fitted with a new Jap engine with valves at the side.

made of less weight. To this particular machine the J.A.P. carburetter is fitted. Another new type is the 7-8 h.p. fitted with mechanically operated valves, having a bore and stroke of 85 by 85. This has the usual type of magneto and drive, and a J.A.P. carburetter is fitted. With mechanically operated valves the machine should be especially useful for those who require a powerful touring machine or one which is eminently suitable for sidecar work. The 7-9 h.p. type is practically unaltered. Reference was made in our last issue to the Carcycle. This is to be seen on the stand, and is well worthy of close examination. It is well to mention here that it is fitted with both accumulator and magneto ignition. The whole presents a very handsome appearance, and it has the advantage which so few passenger machines have, of being really adjustable, for in a very few minutes the machine may be removed from the attachment and the cycle made of use as a single geared solo machine. All the Bat machines are fitted with automatic lubrication, spring frames and forks, and handle-bar control.

Bradbury, No. 78.

A machine with a glorious past has been revived for 1909, and after a lapse is again to be seen at the Stanley Show. This is our old friend, the Bradbury, which behaved so conspicuously in the early A.C.U. and M.C.C. Trials. The engine, which has a bore and stroke of 87 by 87, is called $3\frac{1}{2}$ h.p., and is provided with mechanically operated valves, while the main shaft runs on ball bearings. It is fitted with a magneto driven by a chain enclosed in an aluminium case. Both pedals and footrests are provided, and on the latter is a control pedal, which works the brake acting on the belt rim. The frame is low, and girder spring forks are fitted. A separate luggage carrier is supplied, while a stand is attached to a lug on the back forks. The machine is well fitted out, and the tank is provided with a petrol gauge and an enclosed pump.

Bransom No. 107.

Messrs. Bransom and Co. are showing a double-seated trailer provided with brakes controlled from the cycle. A description of this was published on page 900 last week.

Brown, No. 265 Gallery.

Brown motor cycles have been improved in several details for 1909, some of the improvements being as follows: Handle-bar controlled carburetter, spring forks, new pattern of exhaust valve lifter, improved method of building up the rear stays, and various other smaller details. We tried a $3\frac{1}{2}$

h.p. Brown machine during the summer and were quite pleased with its behaviour in our hands, for it never once gave any trouble during the several hundred miles we rode it. Brown motor cycles have no flimsy parts in their construction, and can be classed among the most serviceable machines on the market. They are built of strong parts to stand rough usage, and those on exhibition are splendidly finished, and fitted up complete with stand attached to the chain stays, and footrests. Either accumulator or magneto ignition can be supplied, but when the latter is fitted, the Bosch magneto is driven by a train of gears, enclosed in a neat case. The models shown include $3\frac{1}{2}$ h.p. single-cylinder machines, $5\frac{1}{2}$ h.p. twin-cylinder machines with mechanically-operated inlet valves, also a $3\frac{1}{2}$ h.p. machine with two-speed gear and free engine on the main shaft, and chain drive. This latter machine has a Mills and Fulford Castor wheel sidecar, and the two make a very imposing combination. All 1909 Brown motor bicycles will have adjustable

engine pulleys, the several advantages of which are well known to our readers.

Chater Lea, No. 228 Gallery.

A number of alterations have been made to the Chater-Lea Carette. The 6 h.p. air-cooled engine is retained, but a three-speed gear of the Panhard sliding type is now fitted transversely in the frame, the main shaft being extended the whole width of the chassis, terminating in a sprocket, which drives on to the near side rear wheel. Only one wheel is driven, and thus the necessity for a differential gear is done away with. Fitted with a magneto, the number of working parts seem to be very few indeed, and there is a noticeable absence of wiring, levers, and loose parts. The engine at the side is in a most accessible position; in fact, in making an adjustment one could almost imagine that the engine was on a bench. More rake has been put on the steering wheel,

Specimen of $3\frac{1}{2}$ h.p. Brown Magneto Model, with spring forks and handle-bar controlled carburetter.

Motor Cycles at the Stanley Show.—

and the comfort of the passengers' seats increased. The two-speed twin-cylinder chain-driven bicycle, built especially for sidecar work, was illustrated in our last issue. It is just the machine for serious touring with a sidecar attachment. A new lightweight is also shown on this stand fitted with a $2\frac{1}{2}$ h.p. J.A.P. engine. The design of this machine is on quite up-to-date lines, but it was exhibited in an incomplete state. Rubber-covered footrests can now be obtained from Chater-Lea, Ltd., together with a foot brake attachment all complete.

Douglas, No. 65.

Several improvements are embodied in these well-known lightweight machines for 1909. The engine is now carried lower down on an additional horizontal tube in the frame. A separate luggage carrier is fitted, and a stand attached to

Pistons, connecting rods, timing gear wheels, and gear driven magneto of the $2\frac{1}{2}$ h.p. Douglas, which has a horizontal engine with opposed cylinders.

lugs on the back forks, which allows the back wheel to be removed without difficulty. The machine has also been considerably lightened, and a model is shown suspended from a spring balance, which registers 106 lbs. Adjustable foot-rests are provided, and in one end of these is carried a plated brass tube, which can be used as a front wheel stand, since it fits into the vertical tube which forms a part of the

diagonal tube of the frame. The carburetter can be removed by merely undoing two nuts, and its interior mechanism has been somewhat altered. A choke tube is provided, which acts as a throttle—that is to say, the outer portion of the choke tube acts as a sleeve throttle, while the fact of altering its position causes the mixture to be enriched, as the quantity of air is shut off. Druid spring forks are fitted in all cases, and these are strengthened by means of a girder. It is interesting to note that this is one of the few machines with horizontal cylinders which are provided with vertical valves. This

The improved $2\frac{1}{2}$ h.p. Douglas Lightweight.

new model was successfully used in the Quarterly Trials last October. The throttle and air levers are controlled from the handle-bar. The pump is now fitted inside the tank, and it is provided with a non-return valve, so that the oil cannot be inadvertently pushed back into the tank, and the tap must be opened to admit the oil into the engine. The back brake is operated by means of a pedal situated on the footrest controlling a shoe acting on the belt rim. These machines are all fitted with $2\frac{3}{4}$ h.p. engines with horizontal cylinders opposed, with a bore and stroke of 60 by 60, developing a horse-power of $2\frac{3}{4}$. With each machine a well-equipped tool roll is supplied.

Elgin, No. 313 Gilbey Hall.

The Elgin motor bicycle is a $1\frac{1}{2}$ h.p. lightweight model, weighing unladen about 60 lbs. It is made in two patterns, for ladies and gentlemen, the first model being battery ignited and the other provided with a Ruthardt magneto machine, chain driven. The engine is of the two-stroke variety, with a bore of 45 mm. and a stroke of 90 mm. The gas is induced through an automatic inlet valve at the base of the cylinder, compressed in the crank chamber, and driven up to the combustion head from ports in the cylinder walls. A baffle plate on the top of the piston deflects the incoming gas, and prevents it mixing with the exhaust gases. The crankshaft has ball bearings. The transmission is by an ordinary $\frac{5}{16}$ in. leather V belt without jockey pulley. There is a petrol tank capacity of 100 miles. The oil compartment communicates by means of a pipe and tap with the cylinder, the feed being regulated by the rider, who has under his control a small tap under the tank. In the case of the battery ignited machine the speed is controlled by means of a combined compression release valve and advance spark to contact breaker. The magneto ignited machine has the compression release valve only. Two brakes are fitted—a rim brake on the front wheel, and a back-peddalling coaster rim brake on the rear wheel. A complete engine set is also sold for fitting to roadster pedal bicycles.

F.N., No. 130.

The *pièce de résistance* on the F.N. stand is obviously the new pattern $2\frac{1}{4}$ h.p. F.N. motor bicycle, with two-speed gear and bevel gear transmission. This machine is quite a little gem of lightweight construction, possessing practically every-

Showing the whole of the working parts of the new F.N. two-speed bevel driven lightweight.

thing that motor cyclists have asked for for some time past. Using the curved stamped cradle, which is a feature of the F.N. model, a $2\frac{1}{4}$ h.p. engine is placed transversely in the frame. This engine has an outside flywheel, and a small gear box is situated immediately behind it. In the box are a set of pinions which provide for two speeds. To change gear, one lever is used to withdraw the clutch and change the gear, and the gear cannot be changed without the clutch being first withdrawn. A special feature of the machine is that the whole of the transmission and clutch mechanism has been designed on motor car lines; that is to say, there is a universal joint at each end of the propeller-shaft and also between the clutch and the gear box. The cone clutch is withdrawn by being pushed inwards. When the clutch is engaged the two faces are quite flush, and no dirt or dust can get in to damage the clutch leather. The other F.N. models—the $1\frac{1}{2}$ h.p. lightweight belt-driven and the four-cylinder gear-driven—are, of course, well represented. The change speed gear for passenger work fitted to the four-cylinder F.N. should be examined. This gear is operated by means of dog clutches, and we hope to illustrate it very shortly. The box containing the gear is fitted between the bevel and the spur gear transmission, and is bolted around the propeller-shaft casing.

Humber, No. 98.

A firm which we are very glad to see has taken up again the manufacture of motor bicycles is Messrs. Humber, Ltd. In their new model they have produced a machine which is well worthy of the reputation Messrs. Humber enjoyed a few years ago with their older machines. In the new design the machine has been thoroughly modernised and

Motor Cycles at the Stanley Show.—

to be seen on this stand the usual outside mudguard stays have been removed, thus rendering the tyre of the sidecar wheel far more accessible.

Moto-Reve, No. 108.

No startling improvements are to be found in this splendid little lightweight, fitted with a 2 h.p. V engine, 50 by 70. All the improvements and alterations are in small but somewhat important details, e.g., the wheels are built somewhat stronger, and substantial 2in. Continental tyres are fitted. A couple of taps with small pipes leading from the tank to the compression taps are provided, so that petrol can be easily injected when the engine is difficult to start. The design of the spring forks is distinctly good, the forks being light, while at the same time they are strengthened by the aid of a girder. An extra release valve has been added to the crank chamber to prevent the oil from being splashed out. Another small but important point is the fitting of a toolbag, which comprises a neat roll, so that the tools can be inserted and the whole neatly rolled up. A new belt rim brake, operated by a pedal on the footrests, deserves special attention, since it is a fitment which is extremely neatly carried out. Another innovation consists of an alternative model, which allows the engine to be carried very low down indeed, rendering it most accessible, so that the cylinders can be removed without detaching the engine from the frame.

Motosacoche, No. 67.

The Motosacoche was one of the first light-weight machines to be introduced in this country. The chief alteration in the 1909 model is a loop frame which brings the engine 2in. lower than formerly. The frame is also strengthened by a diagonal stay close up against the steering pillar. Most models are

Motosacoche Paraffin Pump.

A. Inlet from tank.
B. Delivery to cylinder.

cylinder, which is one of the best multi-cylinder lightweights on the market. The inlet valves are mechanically operated, and what is an extremely important point the radiator fins are horizontal on both cylinders, thus allowing a free draught of air. A paraffin injecting device is also embodied in this model. The Bosch magneto on the twin is driven by means of a shaft and bevel gearing; the whole of the magneto transmission is enclosed in a water-tight aluminium case. The exhaust pipes are held on by a single bolt, and are carried with easy bends to the silencer, from which there extends a long pipe which reaches almost to the back forks, thus rendering the machine very silent. On the twin there is a separate lever for the spark advance, but on the single the entire control is from the handle-bar. Another interest-

ing model seen on this stand is the Motosacoche lady's machine in which the engine is carried vertically on the frame. This engine is fitted with mechanically-operated inlet valves and magneto ignition. The dimensions of the single-cylinder engine are 52 by 72, and those of the twin are 62 by 70 mm.

Norton, No. 87.

A small, but interesting display of machines is to be found upon this stand. The models shown are a 5 h.p. twin, 76×80, and a single-cylinder 82×90. The valves have been considerably enlarged, and the frame has been improved in detail. A new form of stand is fitted as a standard, which is attached to a lug built into the chain stays. A special lug is also built into the frame for carrying the belt rim brake. The oil pump is enclosed in the tank, and is placed nearer the rider than previously. Norton machines look suitable for speed and hard work. The frames are low built, and the wheelbase is long. A novel piston ring is used in the engine, having two grooves for oil.

Segment of the Norton Piston Ring, showing grooves for oil.

N.S.U., Nos. 262 and 263 Gallery.

Probably the most comprehensive range of motor cycles in the whole show is the exhibit of the N.S.U. Co. It would be a very fastidious motor cyclist who could not find what he wanted on the N.S.U. stand. For instance, the models range from 1½ h.p. lightweight to an 8 h.p. twin-cylinder racer, and between these models come the following: The 2½ h.p. twin, 3 h.p. single-cylinder, 4 h.p. single-cylinder, 4 h.p. twin-cylinder, 6 h.p., and 8 h.p.; but the complete range of models is not the only thing, for the N.S.U. Co. make and fit to any of their touring machines a free engine clutch for the engine-shaft and a two-speed gear and free engine for the engine-shaft. If a rider prefers it, he can have a combined two-speed gear and free engine fitted in the back hub instead. All the models are splendidly finished, one of the more powerful machines having a sidecar fitted. The N.S.U. tricar is a very well thought out machine, and should appeal to passenger motor cyclists. It has a two-speed gear and free engine operated by one lever, the frame is sprung in front, the engine is cooled by means of a fan, and almost every recent improvement is embodied in the construction of the machine. A stripped machine for racing purposes is shown of each of the models above referred to, and a section of the new 4 h.p. engine, which shows very clearly the whole working of the engine. The N.S.U. Co. have gone so far to study the requirements of motor cyclists that they are willing to fit automatic or mechanically operated inlet valves to their twin-cylinder machines, according to the individual buyer's preference. The N.S.U. anti-skidding device is shown fitted to one of the twin-cylinder machines, and we are informed that these bands are most effective in

A new model N.S.U. of 4 h.p. The machine illustrated is fitted with a free engine clutch, and another shown at the Stanley has a change speed hub gear.

Motor Cycles at the Stanley Show.—

preventing side-slip. We have been promised a personal trial of these bands on one of the 1909 N.S.U. models, and shall then have something more to say about them. N.S.U. motor cycles are supplied complete ready for the road with spring forks, stand and carrier (the stand being fitted to the chain stays to allow of easy withdrawal of the back wheel), number plates, toolbag with tools, oilcan, etc. Handle-bar control has been adopted on the N.S.U. models, the levers being particularly neat, and operating by means of wires sliding pistons in the carburetter. In a word, to miss the N.S.U. stand would be to miss one of the features of the whole show.

Oakleigh, No. 106.

On this stand rigid and flexible sidecars are to be seen. A sidecar fitted with a spring suspended wheel is also shown. This wheel has already been described in our pages. Another interesting attachment is a castor-flex sidecar, which is a flexible sidecar, allowing the machine to be ridden as an ordinary bicycle, which has a castor wheel action, a joint allowing the sidecar wheel to follow the track made by the motor bicycle to a limited extent. Most of the sidecars are fitted with well-shaped seats, made in either wicker or cane, and upholstered in pegamoid. Besides the above, a system of spring back motor cycle is shown. Another accessory is a useful pan seat provided with a padded cushion.

Phanomen, No. 114.

Some interesting machines are to be seen upon this stand. One of the most attractive is the 6 h.p. twin—74 x 84—enamelled entirely grey. There are no bright parts about the machine at all except the handle-bars. As regards colour the machine carries with it a strong reminiscence of a British ironclad. The result is that this motor bicycle is distinctly businesslike in appearance. It is fitted with the well known Nala two-speed gear, which is controlled by one lever. An enclosed fan is also fitted as well as spring forks. Another attractive machine is a 4 h.p. single—86 x 84—enamelled cream. This is fitted with the Brown and Barlow handle-bar controlled carburetter. On all the machines the magneto is carried horizontally underneath the bottom bracket. In the pages of *The Motor Cycle* "Ixion" has made a point of the lightweight twin-cylinder. A machine which comes near his ideal is the 4 h.p. Phanomen—67 x 72—fitted with spring forks and Nala two-speed gear. On this stand the main parts of Phanomen machines are displayed upon a table as well as a complete engine. Enthusiastic motorists will do well to examine the excellent workmanship displayed in these.

The new 2½ h.p. Twin-cylinder Lightweight N.S.U. Engine. Its special features are handle-bar controlled carburetter, M.O.I.V., geared down engine pulley, and gear-driven magneto.

The magneto machine is driven by means of gear wheels, the transmission being particularly well carried out. The half-time wheels and cams and the spindles which carry them are made out of one piece, while the main shaft spindle has the small timing wheel turned solid with it, and at the further end is carried the small pinion driving the magneto. This is held on by a hardened steel pin. A 6 h.p. twin with two-speed gear is shown attached to a rigid sidecar, while we understand that a Phänomobile will be shown at a later date. This machine was described at the beginning of the year in our pages.

Premier, No. 79.

A new 3½ h.p. Premier motor bicycle makes its *début* before the public on this stand. It is a splendid example of the best possible workmanship, while the finish is beyond all praise. The engine is the famous White and Poppe, fed by a Brown and Barlow carburetter, controlled from the handle-bar and the latest type of Bosch magneto driven by an enclosed chain. In future engines, we understand that ball bearings will be fitted, while the engine is already provided with adjustable valve tappets. The machine shown is fitted with Chater Lea spring forks, but we are informed that a new fork of novel design will be embodied on future models. Pedals as well as footrests are provided. The engine will be fitted with a compression tap with the sparking plug arranged on it so that if the rider desires it the plug may be carried in the centre of the cylinder, or two plugs may be used simultaneously. The new Premier is equipped complete ready for the road, including stand attached to the chain stays, tubular carrier, and footrests. A Davison petrol gauge is fitted in the tank, which latter has a capacity exceeding one gallon. We understand that the Premier Co. intend to enter thoroughly into the manufacture of motor cycles, and that the Premier machine will figure largely in 1909 competitions.

Pringle, No. 84.

A motor bicycle with a new type of frame is shown on this stand. The Sinclair patent frame comprises three main tubes, two of which extend parallel to one another from the lower end of the steering head, one on either side, with suitable curves to the back forks, to which the rear wheel is connected. The other main tube extends from the top of the steering head to the seat-pillar, all three being brazed together at the bottom of the loop, and completed with the necessary lugs and stays. The frame is of quite original design, and can be used by either a lady or a gentleman. The engine is a 3½ h.p. Minerva, fired by an Eisemann self-contained magneto. An Osborne four-speed pulley is fitted, and a dressguard is provided just behind the engine. A Brooks motor cycle saddle is fitted.

The first 3½ h.p. Premier Motor Bicycle, with Bosch magneto and Brown and Barlow handle-bar controlled carburetter

Motor Cycles at the Stanley Show.—**Quadrant, No. 109.**

The new Quadrant, the engine of which was described in a recent issue of *The Motor Cycle*, is shown here for the first time. This engine has a bore of 84 mm. It will be as well to recall the fact that the chief points about it are that the engine, carburetter, magneto, and silencer form one unit, but the cylinder may be removed without removing the crank case from the frame, and, moreover, the timing wheels are easily accessible, and not only can the cylinder be taken off, but the whole of the engine can be dismantled.

Next year's $3\frac{1}{2}$ h.p. Quadrant model. It is controlled by a single lever on the handle-bar.

leaving only the crank case in position. The carburetter fitted is automatic, and only one lever serves to control it, but there is a port on the side of the spray chamber fitted with an adjustable shutter, so that the degree of air admitted can be slightly varied according to the temperature. The frame is low and the wheelbase fairly long, while spring forks of the Quadrant type are fitted. These forks are duplex, and provided with longer bearings, being strengthened by means of a girder. Two brakes are fitted, one acting on the rear rim and the other on the rear belt pulley. We understand that in future models a back pedalling band brake will be provided. A special machine presents a very handsome appearance, and one of the chief points about it is the safe place in which the magneto is situated, being well out of the way of mud and wet. The oil pump is enclosed, and is thus free from damage. One of the machines exhibited is shown fitted to a rigid sidecar, while a Roc two-speed gear outfit, complete with back forks, is also to be seen.

Rex, No. 76.

Four distinct types of the well-known Rex motor bicycles are to be seen on this stand. The $3\frac{1}{2}$ h.p. single and the 5 h.p. twin both fitted with pedalling gear, and the $3\frac{1}{2}$ h.p.

A 1909 Rex de Luxe Twin-cylinder Bicycle equipped with two-speed gear and free engine.

single de luxe with two speeds, and a 5 h.p. with two-speed gear. Ball bearings are fitted to the main engine shafts in all cases, as well as a domed piston with two rings, one on the top of the piston and the other at the bottom. The new spring fork fitted to Rex models is well worthy of attention. The forks are of the girder type, and the springs are enclosed in tubes attached to lugs brazed on to the forks themselves. The springs are on both sides of the spindle, so that the forks are smooth and efficient in action. These forks allow the front wheel to be easily removed, which is a distinct improvement over last year's model. The mudguards are wide and efficient, and the mudguard flap is incorporated with the guard itself. On all models the Amac carburetter with handle-bar control is fitted. Some excellent specimens of the fine work turned out by the Rex Co. are displayed upon the stand. A dismantled engine is shown showing the excellent finish of the cylinder and the neat fitting of the crankshaft ball bearing, as well as the timing gear arrangements in which both valves are operated by one cam. The new frame is particularly neat, as the Rex cantilever spring saddle-pillar can be fitted to both the tourist and de luxe models. The frames are finished in black enamel, and present a very smart well-finished appearance, while the tanks are enamelled aluminium with a deep blue panel. A separate luggage carrier of ample dimensions is fitted, also a stand which we have previously described. The Rex machines present a neat, workmanlike appearance, and we congratulate the company upon the advance made in the finish and design of the 1909 models. The tricars referred to in our forecast issue were not in evidence on the opening day, but we hope to refer to them next week in our third and last show number.

Roc, No. 81.

An interesting display of Roc machines is to be seen on this stand. The chief improvement for 1909 lies in the new spring forks, of which the movable members are hung on C-springs working on telescopic tubes attached to a bracket on the head. Small detail improvements are also embodied in the two-speed gear. A further means of adjustment is provided for the top speed clutch, and the design of the live axle bearings and clutch has also been improved. Two absolutely independent back brakes are fitted, situated side by side. These brakes carry little studs at intervals, which engage with a steel drum, giving, we understand, a very smooth action. The two models shown are the 4 h.p. single (83 by 90 mm.) and the new 5-6 h.p. twin (75 by 80 mm.). These engines are now fitted with mechanically operated valves—an improvement which we are very glad to see. The twin-cylinder is shown fitted to a Castor wheel sidecar, while a single-cylinder is exhibited with two-speed gear attached to a Castor wheel sidecar, carrying a delivery box engraved with the name of William Whiteley, Ltd. A special point made for next year is the Roc conversion set, embodying the complete rear portion of the machine, comprising the two-speed gear, fitted with the Roc control. These are now supplied to fit practically every make of motor bicycle.

The new pattern Roc Twin-cylinder Ball-bearing Engine with mechanically-operated valves.

Motor Cycles at the Stanley Show.—

Service Co., Ltd., No. 116.

One of the most interesting and varied exhibits including all the different makes of motor cycles for which the company are agents. They comprise the Moto-Rève, L.M.C., four-cylinder F.N., $3\frac{1}{2}$ h.p. single cylinder Triumph, $3\frac{1}{2}$ h.p. Rex, Millford Castor wheel sidecar with a board on axle for luggage, a N.S.U. with Wysall's patent seat and steering wheel, and six examples of the Phelon and Moore two-speed

The geared-up handle-starting arrangement on the $3\frac{1}{2}$ h.p. 1909 two-speed P. & M.

geared motor bicycle. The latter machine is not represented elsewhere in the show, therefore we may here devote a few lines to a description of its latest improvement. This is in connection with the starting device which is illustrated in the annexed line sketch. Previous to this show the handle was fixed on the engine-shaft, which could not be revolved rapidly enough to ensure a hot spark from the magneto. The handle is now attached to a stud carried on a plate which is riveted to the low speed chain wheel of the counter-shaft, and forms at the same time a cover plate for the wedge bar clutch mechanism.

Triumph, No. 122.

A number of superbly-finished Triumph motor cycles are shown, the two 1908 patterns being retained for next year, viz., the $3\frac{1}{2}$ h.p. standard Triumph and the $3\frac{1}{2}$ h.p. Tourist Trophy model. Both models have been improved in various details, the chief advances being in the engine. The size of the engine remains the same as last year, viz., 84 by 86 mm., but the compression is slightly higher. The design of the piston has been considerably altered. It is shown in the accompanying illustration, and it will be noticed that it is dome shaped, and one ring is fitted at the top and one at

The dome-shaped piston on the 1909 Triumph. Note the step cut rings, one at the top and one at the bottom of the piston.

the bottom. The whole length of the piston is a good fit in the cylinder. It is claimed by this construction that there is a more even thrust on the cylinder, and, consequently, wear is less likely to take place. The mud flap is now made more of a protection for the magneto, and is attached to the magneto support, entirely away from the front mud-guard. The neat generator clip on the tank will be found extremely useful, and will do away with the necessity of fitting what was in most cases an ugly protuberance on the front forks. Brooks's hogskin top seats have been adopted as standard for the touring machines, a larger tool-bag fitted to the carrier, and Clincher rubber studded motor cycle tyres. Palmer or other makes can be obtained to special order. The T.T. model is much lighter than the touring model, and has no pedals. It was illustrated on page 898 last week. Triumph motor cycles have proved themselves absolutely reliable in the hands of all classes of riders, and when one examines closely the excellent finish and workmanship, it is not difficult to account for the enormous popularity they enjoy.

Vindec, No. 127.

A finely-finished collection of Vindec motor cycles, which for 1909 are coloured Vindec grey, lined black and red, with white panels to the tanks. Brooks's saddles are fitted to all models, the saddle springs even being coloured to match the frame and wheels. The *tout ensemble* of this exhibit makes a most tasteful and attractively finished stand. All models are shown— $3\frac{1}{2}$ h.p. single-cylinder, 5 h.p. twin-cylinder, and 7-9 h.p. twin-cylinder. The position of the carburetter has been slightly altered. It is now fitted midway between the two cylinders. The induction pipe can still be detached, or the inlet valve domes removed with the greatest facility. A new adjustment is provided for the handle-bars. In addition to the vertical adjustment, the handle-bar is now adjustable radially, so accommodating riders with various ideas as to the most comfortable position for the grips. An ingenious little arrangement to prevent the crank axle revolving is a spring catch which engages between the teeth of the sprocket wheel. It allows the bracket axle to be rotated in either direction, yet does not allow the cranks to revolve even if the free-wheel is slightly clogged. Tubular luggage-carriers are now fitted to all roadster machines. A fine example of the Vindec racer, 7-9 h.p., and a 5 h.p. twin with sidecar enamelled to match the frame of the motor cycle, complete a most interesting exhibit. Samples of the parts used in the new Vindec models can be inspected in a show case at one end of the stand. Among these is a new pattern silencer, which is lined inside with sheet asbestos, the exhaust pipe being slotted, the total number of slots being equal to several times the area of the opening of the exhaust valve. The new adjustment for the lift of the inlet valve can also be seen. Mr. Wells informed us that he had not noticed any signs of wear on this type of inlet valve in 2,500 miles running. The adjustment is provided not so much to compensate for wear as to allow for tuning up the

The $3\frac{1}{2}$ h.p. 1909 pattern touring Triumph. In outward appearance it is much the same as this year's model, the chief improvements being in the engine.

Motor Cycles at the Stanley Show.—

engine to give a small or large opening, according to the speed or hill-climbing requirements.

Vindec, No. 297 Gilbey Hall.

An entirely new model of small runabout on motor cycle lines, called the Vindec Runabout. This is a four-wheeled machine, with air-cooled 7.9 h.p. Vindec-Peugeot twin-cylinder air-cooled engine, arranged longitudinally in front under a bonnet. Transmission from the engine to the gear box is by means of a chain, the final drive being by means of a motor cycle belt to a belt rim on the left-hand rear wheel, which is the only driver, the right-hand rear wheel running loose on the shaft. There is no differential gear. The starting is effected by a handle which fits on the starting shaft midway between two side wheels. This shaft is connected to the gear box. A lubricator is fitted on the dashboard with sight drip feeds. The brakes are two rear wheel external band brakes operated by side lever, which is interconnected with the clutch pedal. Another pedal on the right-hand side operates the exhaust lifter. The wheels are all of equal diameter and size 26in. by 2½in., the rear covers being studded Excelsiors and the front ribbed Excelsiors. This machine has a most taking appearance, and will appeal strongly to motor cyclists who are contemplating a sociable vehicle of the four-wheeled variety. It is extremely light.

Wolf, Nos. 57 and 58.

Several interesting machines are shown on these stands, ranging from the smallest to the largest. The first is the 1½ h.p., weighing about 70 lbs., fitted with an engine having a bore and stroke of 63 × 63 mm., carried in an inclined position and fired by accumulator and coil. The frame is 22in., and rigid forks are supplied. This machine is sold at a very moderate price. Another machine of the same horse-power with slightly lower frame, viz., 20in., is fitted with a Ruthardt magneto, and has a direct belt drive; it weighs about 3 lbs. more than the battery ignited model. The next machine is also of 1½ h.p., magneto ignited, and follows the same lines, but is fitted with larger tyres. Two distinctive models of the 20in. frame are built with engine fitted low down, clamped to the down tube in a slightly inclined position, as illustrated below. The ignition is by Ruthardt magneto, driven by an enclosed chain, and with outside flywheels similar to the other models previously reported, but with Druid spring forks. The belt rim brake is operated by the foot on a pedal fixed to the leather-covered foot-rests. It is, in common with the other models shown, fitted with handle-bar control. This machine weighs about 80 lbs. The most interesting model

Vindec Adjustable Inlet Valve.
A. Nut for adjusting lift.
B. Lock-nut.

on the stand is the new 3-3½ h.p. twin, built in accordance with the specification suggested by "Ixion" in *The Motor Cycle*. The bore and stroke are 63 × 63 mm., and the carburetter is carried midway between the two cylinders. Both carburetter and engine have been designed by Mr. Stevens, the originator of the well-known Stevens engine. The ignition is by Ruthardt magneto, driven by an enclosed chain, while the silencer is carried in the proper place, underneath the bottom bracket, the exhaust pipes being large in diameter. A neat fitting is the provision of a couple of branch pipes leading from the tank to the cylinders, provided with a tap for the cylinders, and a separate needle valve on each compression tap, so that it is only necessary to turn on the first-named tap and the pipes fill up, and when the valves are open sufficient petrol reaches the cylinders to allow the engine to be started easily. Druid spring forks are fitted, and the back mudguard is halved and hinged, so that the rear tyre is most accessible. Rubber-covered footrests are provided, and on the near side the brake pedal is to be found. This brake acts on the belt rim. The machine only weighs 116 lbs., is low in the frame, being only 20in. from the ground, and has a wheelbase of 49in. Another interesting fitment is the provision of a short stand underneath the crank case, which allows the front wheel to be jacked up. The rear stand enables the back wheel to be easily removed if necessary. In short, the machine is a thoroughly practicable lightweight twin. The detail work is excellent. A new type of exhaust lifter is fitted, which is highly efficient and should work well, while the relief valve leads into a long pipe, which catches any excess of oil and allows it to escape on the ground. No less than seven different types of machines are to be found on this stand, only differing from each other in small details, but the three distinct types are a twin, the low-frame single-cylinder with practically vertical engine, and a cheaper form of machine with enclosed engine. The twin just described has enclosed flywheels, while the others have an outside flywheel.

Zenith, No. 124.

Several specimens of Zenette spring frame motor cycles are exhibited, both with and without the Gradua gear. Although we have previously illustrated and described the action of the Zenette spring frame, we may remind our readers that its action is similar to that of a pair of scissors, the movement being controlled by long coil springs. As regards comfort, this spring frame brings the Zenette near the top notch in motor cycles. The Gradua variable gear has many good points, its two chief advantages being the simplicity of its action and the fact that almost any gear can be obtained. This change of gear is obtained by opening or closing the flanges of the engine pulley, the slack of the belt being taken up by the back wheel sliding backwards. The two movements are obtained by gently turning a hand wheel placed in a convenient position by the side of the tank. Other up-to-date features are adopted in the design of the Zenette, such as a handle-bar controlled carburetter (Longuemare), variable lift of inlet valve, flexible metallic oil pipe, petrol gauge, low frame, and two pairs of footrests. A Zenette machine without the spring frame but with Druid spring forks was illustrated on page 899 last week.

A Single-cylinder Wolf Lightweight, with Ruthardt magneto and Druid spring forks.

One of the few ladies' motor cycles—shown by the Victoria Trading Co.

TIME TO LIGHT LAMPS.—Nov. 25th, 4.59 p.m.; Nov. 28th, 4.56 p.m.; Dec. 2nd, 4.53 p.m.

Electrically Propelled Tricars.

Quite a number of readers have written for the address of the makers of the Harborn electrical tricycle, which was illustrated in our issue of the 4th and 11th insts. This goes to prove that a really practical passenger machine on the same lines would meet with a good demand in this country.

A Club for Newcastle, Staffs.

It is proposed to start a motor cycle club in Newcastle-under-Lyme, Staffs., and with this object a meeting has been arranged at the Castle Hotel, Newcastle, on Monday next, the 30th inst., at 8 p.m. All motor cyclists in the district are asked to attend the meeting. The hon. secretary *pro tem.* is Mr. J. H. Higson, Northcote Place, Newcastle, Staffs., to whom all communications should be addressed.

A Measured Stretch at Darlington.

A number of motor cyclists and car drivers were recently fined at the Darlington Police Court for exceeding the legal limit over a measured stretch of 290 yards of road near the park. There is a school in the middle of the control. The Town Clerk pointed out that signboards had been erected, but were not taken notice of, though as soon as more care was exercised in driving in the town there would be no more prosecutions.

A Curious Conviction.

T. W. Worrall, of Walsall, was last week fined £5 and £1 18s. 6d. costs at Penkridge for driving to the danger of the public. Judging by a daily paper report of the case, the fine seems altogether too heavy, seeing that all the witnesses admitted that there was no one on the road at the time. A constable in plain clothes said that Worrall and another motor cyclist were racing at the very least 40 m.p.h., and he was unable to take the number of the second cycle owing to the speed at which they were going.

The Motor Union and Motor Cyclists.

The November meeting of the Motor Cycle Committee of the Motor Union of Great Britain and Ireland was held at 1, Albemarle Street, London, W. The Motor Union scheme of membership for motor cyclists has proved exceedingly popular. Under it members may have the full privileges of membership of the Union for half a guinea, including a copy weekly of *The Motor Cycle*, and these privileges plus an insurance policy for one guinea. During October twenty-one new motor cyclists joined the Union under the scheme. They were drawn from all parts of the country.

Germany's Trade in Motor Cycles.

In the third quarter of the current year Germany imported motor cycles weighing collectively 4,600 kilogs., representing seventy machines, as against 4,000 kilogs. during a like period in 1907. Her exports dropped from 42,200 kilogs. to 26,800 kilogs., taking the same basis of comparison. Belgium doubled her sales, Austro-Hungary's figures remaining the same. Notice the falling off in the purchases of the three most important buyers of German machines: Denmark, third quarter 1908, 1,600 kilogs.; third quarter 1907, 3,300 kilogs. Great Britain, 6,100 kilogs. and 13,500 kilogs. Holland, 2,600 kilogs. and 3,000 kilogs. Great Britain's purchases declined more than fifty per cent., it will be seen.

American Championship Race.

The Federation of American Motor Cyclists' National Championship Race was held on the Morris Park Track, New York, on the 3rd inst. These championships are competed for annually, and are the means of picking out the best riders in the States. The races this year were held on a mile flat dirt track, and the times are considered remarkable when it is taken into consideration that the riders had no banked curves to help them negotiate the corners at full speed. The best time for a mile on a track of this kind is 54½s. One hour, 61¾ miles. Both records are held by Fred Huyck and his 7 h.p. twin Indian. Twenty-five thousand spectators witnessed the last race meet. Although held in combination with an exhibition of flying machines—not one of which flew—it is safe to say,

judging by the enthusiasm, that everybody was there to see the motor cyclists race against Father Time. There were a dozen competitors in all on Indian, N.S.U., Peugeot, P.R.S., and Merkle motor cycles.

Motor Cycle Show in Edinburgh.

At a largely attended meeting of the motor cycle and cycle trade, held in Edinburgh on Monday, November 16th, consideration was given to the proposal of the Scottish Cyclists' Union that a show should be held in Edinburgh in the beginning of 1909. The feeling was that it was not possible to make preparations for a successful show in so short a time, but it was resolved that a show should be held annually, the first about the beginning of 1910. An association was formed, with the title of the "Scottish Cycle Trade Show Association," with this object in view, Mr. Richard Johnstone, S.S.C., 45, Frederick Street, Edinburgh, was appointed secretary *pro tem.* The meeting resolved to recommend manufacturers and agents not to exhibit at any show in Scotland prior to the 1910 exhibition, and gave expression to the view that any show in which the main feature was not motor cycles or cycles, was of no advantage to the trade. Members of the motor cycle and cycle trade in Scotland wishing to become members of the new association are invited to communicate with the secretary as above, who was instructed to call a meeting of those interested towards the end of the year, for the purpose of framing the rules and regulations.

One of the 1909 Vindex two-speed models (a 5 h.p. twin) exhibited by the Vindex Motor Cycle Co. at the Stanley Show. (See page 923.)

Police Traps.

We are advised that a very active police trap is in operation in Shooters Hill Road, near Blackheath, S.E.

Accident to a Well-known Camper.

We much regret to hear that Mr. T. H. Holding, the well-known authority on camping, met with rather a severe accident recently while bicycling in Bond Street, London. Although he has suffered great pain in consequence of the accident, it is not thought that any bones are broken, and we believe that he is now well on the way to recovery.

Magneto Machines.

During the last few days we have had no less than five new pattern magneto machines for motor cycles submitted to us. One of these is described and illustrated this week in a separate article. One is mentioned in the description of the Stanley Show exhibits, another was described in the Olympia show report, and two remain to be dealt with as soon as space permits.

Next Week's Issue.

In the next issue of *The Motor Cycle* we hope to publish a criticism of the motor cycle exhibits at the Stanley Show, written by Mr. B. H. Davies; also a statistical table compiled by Mr. H. Hewitt Griffin, showing the number of each of the various types of motor cycle on exhibition.

Motor Cycle Stolen.

Mr. H. Raven, 6, Beacontail Avenue, Walthamstow, advises us that he had a motor bicycle stolen from the rear of the above premises on the night of Friday, the 13th inst. The description of the machine is as follows: 6 h.p. Bat-Jap twin a.o.i.v. spring frame and forks, Modèle de Course tyres, Longuemare carburetter, registration number A 9,453, and engine number 3,543. Any reader who is offered a machine corresponding with the above particulars is requested to communicate with Mr. Raven at the above address.

"The Autocar" Lectures.

At the close of the lecture which was delivered at Birmingham on Wednesday, November 11th, by Dr. Ormandy, it was announced that there would be no lectures at the Newcastle, Birmingham, and Leeds centres on the 16th, 18th, and 19th inst.

The lectures in each of the above-named centres were therefore extended a week to enable those who wished to do so to attend the Olympia Show.

The above decision will necessitate the course at these three centres being extended to December 16th in Birmingham, December 21st in Newcastle-on-Tyne, and December 17th in Leeds.

The dates of the remaining lectures at each centre are as follow:

LONDON.—3.30 and 8.30 p.m. Dec. 1st.
BIRMINGHAM.—7 p.m. Nov. 25th, Dec. 2nd, 9th, and 16th.
LEEDS.—7.30 p.m. Nov. 26th, Dec. 3rd, 10th, and 17th.

MANCHESTER.—4.0 and 7.30 p.m. Nov. 27th, Dec. 4th and 11th.

NEWCASTLE-ON-TYNE.—7.15 p.m. Nov. 30th, Dec. 7th, 14th, and 21st.

We draw special attention to the fact that to meet the wishes of some of our readers it has been arranged to issue tickets to admit to the remaining lectures of the series at any of the centres at a fee of 10s. 6d. We strongly urge all those who have not yet applied to take advantage of the opportunity now afforded them of gaining a knowledge of the working of a car.

Applications for tickets should be made immediately to *The Autocar* Lecture Secretary, 20, Tudor Street, London, E.C.

failure of the mechanism, an annuity of £450 can be claimed by the next of kin of the person killed, or £500 where property only is concerned. The effect of this extreme legislation has caused the insurance companies to raise their rates 250 per cent., and a movement, originating with the Austrian M.C., has been started to form a co-operative motorists' insurance association, and dispense with the insurance companies and their high rates. The German Association, which comprises 9,000 motor cyclists, has forwarded a recommendation to the Government. This points out the harm such legislation will cause to a growing industry.

Stanley Show Opening Ceremony.

At the inaugural luncheon which followed the opening of the Stanley Show by Sir Albert Rollit on Friday last at the Agricultural Hall, Mr. Robert Todd responded to the toast of the Stanley Show, and said that the feature he noticed in connection with the show was the improvement both in the number and quality of the motor cycles on exhibition. He further said that the motor cycle is now a very different article from what it was a few years ago, and there are now more than 60,000 motor cyclists. Referring to the 1906 Land's End to John-o'-Groat's Trials, he pointed out that the percentage of riders gaining awards was twenty-eight per cent., whereas this year a similar trial held under more adverse conditions resulted in the percentage being increased to fifty-six per cent., thus showing the improvement made in the reliability of motor cycles.

The Handicapping of Motor Cycle Races.

Mr. R. O. Clark, Norwich, wishes us to state that he is not the writer of the letter signed "Five Horse Power."

A Novel Test.

A novel test for demonstrating a car's hill-climbing power and quietness of running under the severest of road tests is, we hear, shortly to be made on a hill said to be peculiarly suitable for such a trial. A phonograph with a blank cylinder will be used to record the actual noise made by the car, but it is not stated where it will be fixed. With a biograph film it should be possible to portray the performance in a very realistic manner.

Touring in France. A Concession.

Members of the Motor Union who contemplate a Continental tour will appreciate a concession just made by the French Government as the result of representations resulting from the proceedings of the Ligue Internationale des Touristes, with which the Motor Union is associated. Motorists in possession of triptyques will be permitted to make their first entry or last exit on Sundays and fête days, the regulations hitherto having permitted the Custom houses to be open only on weekdays. The new arrangement will apply only on roads over which the greatest amount of motor traffic passes, but it will prove a great convenience.

FUTURE EVENTS.

Nov. 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.

Dec. 12—Motor Cycling Club Annual Dinner.

„ 12. (Provisional)—Essex M.C. Paper by Mr. H. G. Cove on "Motor Cycles, Accessories, etc."

„ 16—Motor Union General Committee Meeting.

Jan. 7 (Provisional)—Essex M.C. Paper by Mr. H. M. Wyatt on "Magnetos."

„ 16-23—Motor Cycle Show at Madison Square Garden, New York.

„ 23 (Provisional)—Essex M.C. Annual Dinner.

German Automobile Liability Bill.

The above Bill which is now before the German House will, if it passes, make motorists liable for accidents however caused; it will even make the motorist responsible for the failure of a brake or any other part of a motor vehicle, if such failure causes an accident. In case of fatal personal damage, which can be traced to the

**Books for
Motor Cyclists****Motor Cycles & How to Manage Them.**

Price 1/2, post free. 12th edition. Entirely rewritten and brought right up to date. Useful alike to expert and novice. The whole of the information given is applicable to any of the leading makes of motor cycles on the market.

Hints & Tips for Motor Cyclists.

Price 1/2, post free. Reprinted from *The Motor Cycle*, and now issued in book form for the first time. Contains information of much value to all motor cyclists.

"The Autocar" Folding Map of England and Wales.

Price 8/10, post free. A real necessity when on tour. It is well printed on linen, and folds up into a neat and strong case, 7½ × 9½ in. An indispensable motor cyclist's companion.

A full list sent on receipt of postcard.
ILIFFE & SONS LTD.,
20, TUDOR ST., LONDON, E.C.

North-west London M.C.C.

Will members please note that the annual dinner will be held on December 19th, not the 5th, as previously arranged? Full particulars will be sent to the members within the next few days.

Newcastle and District M.C.C.

Notice is hereby given that a special general meeting of the above club will be held at the Barras Bridge Hotel, Sandyford Road, Newcastle, on Wednesday, December 2nd, at 7.30 p.m., by the direction of the committee to consider special business.

Members will please note that a club dance and whist drive has been arranged for Wednesday, December 16th, at the Minories Assembly Rooms, Jesmond Road. Tickets may be had from members of the committee or the hon. sec., Mr. S. W. Carty, 32, St. Mary's Place, Newcastle.

Sunderland and District M.C.C.

A special meeting of members will be held at 11, John Street, on Monday, November 30th, at 8 p.m.

The annual smoking concert will be held at the Grand Hotel on Wednesday, December 9th, at 8 p.m., to present the prizes in connection with the season's competitions, etc. Major Vaux will preside.

A large attendance is anticipated of members of the S. and D. M.C.C. and neighbouring clubs, and the committee request members to assist them by attending and bringing friends. Tickets may be had from Mr. Thos. Jameson, hon. sec., 11, King Street, Sunderland.

Ayr and District M.C.C.

The above club brought a highly successful year on the road to a fitting close with a smoking concert and presentation of prizes. The members and friends present numbered over forty. Mr. John Hourston, the genial president, in the course of his address, referred in detail to the work of the club during this, its first year of existence, and also laid considerable stress on the necessity for motorists to unite together for protection of their interests and the development of an industry that had assumed immense proportions in the last few years.

Thereafter, Mr. Grant, Ayr's tramway manager, in a happy and felicitous manner handed over the numerous prizes and medals for the 170 miles reliability run, four in number, to the successful competitors in the year's fixtures.

A splendid programme followed, the success of which was in no small measure due to the indefatigable efforts of the club's secretary, Mr. M. Brown, and a small committee. What with song and story, the evening passed all too quickly. The usual vote of thanks to the chairman, speakers, and artistes, and the singing of "Auld Lang Syne," terminated a most enjoyable evening.

Cambridge University M.C.C.

The results of the fast and slow hill-climb held at Croydon Hill on November 14th are as follows:

Rider and machine.	Fast ascent.	Slow ascent.
W. B. R. Moorehouse (7-9 J.A.P.) ...	22 $\frac{4}{5}$ s. ...	1m. 59 $\frac{1}{2}$ s.
R. G. Heyn (5 $\frac{1}{2}$ Rex) ...	24 $\frac{2}{5}$ s. ...	55s.
N. J. F. Colenso (5-6 Bat) ...	Failed, belt slipping	1m. 25 $\frac{3}{5}$ s.
E. D. Dickson (5 Vindec) ...	26 $\frac{4}{5}$ s. ...	Dis-mounted near top
F. P. Dickson (5 Vindec) ...	39s. ...	Disqualified
C. L. Mere (3 $\frac{1}{2}$ Triumph) ...	31 $\frac{3}{5}$ s. ...	Dis-mounted.
L. J. McCormick (3 $\frac{1}{2}$ Triumph) ...	32 $\frac{3}{5}$ s. ...	"
N. W. Hutchinson (3 $\frac{1}{2}$ Triumph) ...	31 $\frac{1}{5}$ s. ...	"
C. H. Stephenson (5 Vindec) ...	27 $\frac{2}{5}$ s. ...	"

Bradford M.C.C.

The team competition recently promoted by the Bradford Motor Cycle Club brought forth eighteen riders, each team consisting of three members. The route chosen was *via* Harewood, Wetherby, Boroughbridge, to Leeming Bar and back, a distance of about 100 miles. The run was a non-stop, with surprise and stated checks all along the route. The winning team proved to be the one captained by Mr. Bullus, his co-riders being Messrs. Milnes and Moore, all mounted on Phelon and Moore machines. Mr. Bullus made the best individual performance, gaining 288 marks out of a possible 289.

The annual dinner of the club will be held at headquarters, Imperial Hotel, on December 1st, when a good attendance is expected. The club has one of the finest collection of trophies for competition in the North of England.

Nottingham and District M.C.C.

At a committee meeting held at headquarters, the Welbeck Hotel, Nottingham, on the 17th inst., the hon. secretary read a letter from Doctor Bigg (Bingham) notifying that he would be pleased to have the petrol consumption test, for which he had given a gold medal, run off early next year.

The chairman (Mr. J. Elliot Littlewood) reported the visit he, together with other members, had recently paid to the committee of the Long Eaton M.C.C., who wished to become members of the Nottingham and District M.C.C.

All motor cyclists are cordially invited to attend the whist drive, to be held at headquarters to-morrow (Thursday), November 26th. The hon. secretary, Mr. C. A. Aubert Spring, Stratford Road, West Bridgford, will supply the necessary tickets.

Harrogate and District M.C.C.

The members of this club held an impromptu discussion at the Somerset Hotel on Friday night, the 13th inst., a most enjoyable and instructive evening being spent. The idea of the discussion is as follows: Each member is asked to write a question on paper appertaining to motor cycles or motor cycling. Each question is placed in a hat and drawn for in rotation. The speaker's time is limited to five minutes, and the subject is then open to discussion. A most instructive evening was spent, some of the questions and replies being most instructing. Other meetings of a similar nature will be held during the winter months. The next meeting will be held on Friday, December 4th, and will be entitled "Ideas and Impressions of the Stanley Show."

Although Mr. Stanley Webb is not exhibiting the Stanley Dermatine belts at the Show, they are to be found on numerous makes of motor cycles at the stands.

Messrs. Thomas Whittle and Sons, Ltd., Rose and Crown Street, Warrington, the makers of the Whittle Link Grip belt, are making several improvements to their belts for 1909. Full particulars may be obtained on application to the above address.

Among the firms making motor cycles and accessories who will not be found at the Stanley Show may be mentioned H. Reed and Co., 316, Deansgate, Manchester, makers of the Dot motor bicycle. During the present week Messrs. Reed are making a feature of the Tourist Trophy Dot motor cycle at a special price, including spring forks.

THE NEW PENNY EDITION OF "THE AUTOCAR."

Readers of "The Motor Cycle" who are interested in motor cars are reminded of the new Penny Edition of "The Autocar," now obtainable of all Newsagents and Booksellers every Friday Morning.

The Path of the Magneto Current.

It is fairly obvious that magneto machines are little understood by the majority of motor cyclists, nor is it necessary for users to be thoroughly conversant with the working of these machines, on account of their unfailing reliability. Magneto machines have undoubtedly solved seventy-five per cent. of the troubles with motor cycles. Provided the magneto is kept scrupulously clean and oil is not allowed to collect behind or on the contact breaker, nothing will require attention beyond lubricating the bearings in several months' usage. Even riders of considerable experience are yet practically ignorant of the elements of the magneto. There are those, however, who like to know thoroughly the working of their machines, and for this reason we publish a diagram herewith showing the course of the currents in the DA2 Bosch high-tension motor cycle magneto. This system of ignition produces an armature winding a high-tension current without the use of a separate induction coil, which bridges the points of the sparking plug in the form of an arc-like spark. By studying the diagram closely, it will be seen how the condenser is connected across the platinum points, and how the switch, when earthed, carries the whole of the primary current, inde-

instance to help to explain the working of the magneto to various people, and it has been of great use to them.

The second illustration is a longitudinal section and end view of the DA2 magneto, the numbers corresponding with the inscription underneath.

1. Contact plate.
2. Slip ring.
3. Carbon.
4. Carbon holder.
5. Contact breaker.
6. Bell crank lever.

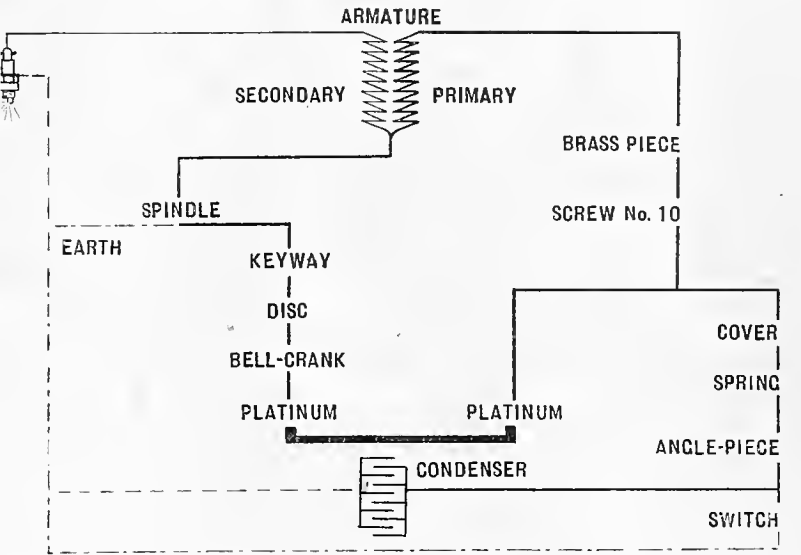

7. Bell crank lever spring.
8. Contact piece.
9. Insulating bush.
10. Fastening screw.
11. Fibre ring.
12. Carbon brush.

13. Brass end cap.
14. Flat spring for end cap.
15. Angular terminal block.
16. Condenser case.
17. Timing lever.
18. Wick screw (for lubricator).

In the above illustration the old pattern contact-breaker cam made of fibre is shown, but on the latest patterns a steel cam, which is less likely to wear, has been adopted, the fibre insulation being on the end of the rocking lever.

A close study of the illustrations will show in a simple manner the working of that interesting machine—the magneto. The latest edition of “Motor Cycles and How to Manage Them” contains a detailed description of Bosch, Eisemann, and Simms magnetos.

“Hints and Tips for Motor Cyclists,” Iliffe and Sons Ltd., 20, Tudor Street, E.C., price 1s. nett, is now ready. These hints and tips first appeared in *The Motor Cycle*, and are now issued in a handy book form, which will be appreciated by our readers who have either mislaid their copies of *The Motor Cycle* in which the hints and tips were printed, or wish to have them bound in a convenient form for reference.

pendent of sparking plug, platinum points, and the condenser. The diagram was plotted out in the first

The Stanley Show.—Continued from page 924.

ENGINES, PARTS, AND FITTINGS.

R. W. COAN, Nos. 157 and 158 (Arcade).—Aluminium castings of all kinds for motor cycle engines: also examples of aluminium parts which have been repaired by R. W. Coan's repair process.

THE GRIFFIN SIMPLEX GEAR Co., No. 176 (Arcade).—The Griffin variable gear for motor bicycles shown in action. This gear can be fitted to any motor bicycle or tricar, belt or chain driven. The example shown is belt driven. To the engine-shaft is keyed an adapter carrying two conical clutches, over which run chain wheels of varying diameters. On the crank case is a counter-shaft carrying a pair of chain wheels, which are solid together, and also of varying diameters. From the smaller of the chain wheels on the clutch shaft power is conveyed to the large chain wheel of the counter-shaft, and from the small chain wheel of the counter-shaft to a large chain wheel on the engine pulley. This is the low gear position. When the clutch is in the midway position the free engine is obtained. To obtain the high gear the engine pulley and the main shaft are clutch connected; the drive is then direct. The clutches are operated by cams and levers connected to suitable control mechanism on the handle-bar.

A Well-tried Engine.

PEUGEOT FRERES, No. 244.—The well-tried Peugeot engine remains unaltered for 1909, and after all it would be difficult to find where improvements could be made, especially in view of its many successes during the past three years. Some riders prefer mechanically operated inlet valves, but at the same time automatic valves have their advantages.

A. D. POWELL AND Co., No. 164 (Arcade).—The Fit-all two-speed motor cycle gear for engine-shaft and rear hub. The latter was fully described and illustrated in *The Motor Cycle* of November 11th, page 875. The latest addition is an improved form of operating gear, by means of rods instead of Bowden wires. The rods are all made with screw adjustment, and the long rod connecting the lever with the handle on the scetor quadrant is telescopic. We hope to test the new hub gear at an early date.

Motors of Various Sizes.

TORMO MANUFACTURING Co. (H. E. FRIEDENHAIN), No. 25.—This firm are exhibiting a new 2 h.p. motor cycle engine, 66×72 mm. The inlet valve is automatically operated, but the exhaust port has been considerably enlarged, and is now pointed in a downward direction. The ignition is by Bosch magneto, and the drive is carried out by means of gear wheels, the lower half of the case forming part of the crank case casting. The type of magneto fitted is the Bosch A1, or lightweight motor cycle type. The weight complete is 40 lbs. The engine is well designed, and should meet with a ready demand. The other types—the 2 h.p. and 5 h.p. single-cylinder, and the 4 h.p., 5 h.p., and 6 h.p. twin—remain unaltered. A new departure is made in a water-cooled engine suitable for tricars. These comprise a 5 h.p., 90 by 100, single, with mechanically operated valves, cast-iron crank case, fitted with either type of ignition; 6 h.p., 7 h.p., and 8 h.p. V twin, 86 by 86, automatic inlet valves, and aluminium crank case; and the 8 h.p. single, 100 by 120, mechanically operated valves, which is practically a facsimile of the present 8 h.p. De Dion.

TYRES AND CLOTHING.

W. AND A. BATES, LTD., No. 205.—Treads of different thicknesses are exhibited here, also a butt-ended tube, the advantages of which are well known.

CALMON RUBBER WORKS, No. 61.—Various types of motor cycle covers are shown. They are heavily built up, and should be suitable for powerful machines, while all types of lighter covers and tubes are also shown.

CAPON, HEATON, AND Co., LTD., No. 60.—A speciality is made by this firm of heavy solid rubber treads, meant to be vulcanised on to partly worn covers. The treads are provided with ribs, which project out a good distance, and which should be effective against skidding, and should wear well. Other motor cycle tyres are shown, and a speciality is made of butt-ended tubes.

CONTINENTAL MOTOR Co., No. 27.—Several innovations in motor cycle tyres are to be seen on this stand. The most novel is the R.O.M. rubber and steel non-skid, consisting of diagonally set oblong rubber projections, between which are

steel studs. These covers obviate the objections to armoured treads, as the number of the steel studs is greatly reduced, thus preventing excessive wear on the roads, while as a non-skid its efficacy is undoubted. The tread is composed of toughened compressed rubber, which is claimed to render the tyre flint and puncture-proof. It can, moreover, be retreaded without difficulty when necessary. Another tyre shown is the all-

Section of the R.O.M. Combination Non-skid.
The studs are of steel and the bars of rubber.

rubber bar non-skid, similar to the above, but without steel studs. Two other types of non-slipping tyres are shown, one of rubber provided with staggered oblong projections, and the other with steel studs projecting through rubber. Some

excellent specimens of the company's retreading work are also exhibited, which are well worthy of special attention.

CONTINENTAL TYRE AND RUBBER Co., LTD., No. 152.—The well-known manufacturers of Continental tyres are introducing several novelties for this season. A new Bat pattern rubber non-skid has been introduced, a steel-studded cover with the studs projecting through rubber, and also a leather steel-studded cover. This is the first year during which the Continental Tyre Co. have introduced non-slipping tyres for motor cycles. It is interesting to note that visitors to the show will recognise the Continental tyres instantly, since the name of the makers is stamped on the covers in red letters. A speciality is, of course, also made of the well-known Continental rubber and canvas belt.

Effective Non-skids.

COVENTRY RUBBER Co., No. 268.—The Three Spires non-skid tyre has now been before the public for some months, and has been well spoken of by users. It is claimed that it is the only non-skid which lasts as long as the tread. A ridge on each side of the tread forms the non-skid, the ridge not coming into action until the bicycle has a tendency to lean to either side. Two patterns of treads are shown, but very similar in design. The Three Spires non-skid tyre can be obtained in different thicknesses for heavyweight and medium weight motor cycles. The thickest tyre is called the *Modèle de Luxe*, and Mr. Jelley, the manager, having furnished us with a pair of these covers for trial purposes, we propose fitting them to one of our own machines, and will let our readers know how the covers wear. A new pattern inner tube will shortly be marketed by the same firm.

EAST LONDON RUBBER Co., Nos. 211 and 212.—Most of the different makes of motor cycle tyres are exhibited here, to great effect. In addition a large quantity of necessary fittings for motor cycles and Kerry engines.

HANOVER RUBBER Co., No. 259.—The Shamrock-Excelsior rubber studded motor cycle covers were only introduced at the beginning of this year, but they immediately sprang into popularity, and they are now fitted to thousands of motor cycles. The Shamrock-Gloria rubber and canvas belt is also largely used by motor cyclists, and sections of all sizes up to 1½ in. wide can be examined on this stand. A lock-joint detachable tube, which we have previously illustrated, is also exhibited on the stand.

Accessories at the Stanley Show.—

MIDLAND RUBBER CO., No. 1.—Strongly constructed motor cycle tyres are to be seen on this stand. These tyres are really car tyres in miniature. They are provided with heavy ribs and tread. Inner tubes and rubber pedals for motor cycles are also exhibited. It is also interesting to note that the motor cycle tubes are heavily made, and all standard sizes are stocked.

MICHELIN TYRE CO., LTD., No. 64.—As regards quality, Michelin tyres have a very enviable reputation. A special point is made of the E.S.T. cover, provided with a very stout, substantial tread for powerful motor bicycles. The well-known Michelin Semelle cover is also shown—one of the best wearing and most efficient (chrome) leather steel studded covers on the market.

An innovation for this company is a light leather treaded, steel studded, non-slipping cover, which is light in weight and yet efficient against side-slip. In putting this cover on the market we feel that the Michelin Tyre Co. are supplying a long felt want.

DAVID MOSELEY AND SONS, LTD., No. 59.—A new motor cycle tyre has been brought out by this well-known firm. It is very substantially made, and the tread is heavy and thick, and is provided with arrow pattern corrugations. It can be had either wired or with beaded edges, the latter type being provided with a flap to prevent the tube being nipped.

Moseley's Non-slipping Tread.

THE NORTH BRITISH RUBBER CO., LTD., Nos. 55 and 56.—The Clincher tyres for 1909 are now made by a new process, which allows a pressure to be obtained never before equalled in the manufacture of tyres. This, we understand, is most important in lengthening their life. The most distinctive model on the stand is the rubber-studded cover, which was used with great success by Mr. A. W. Bentley on his famous ride from John-o'-Groat's to Land's End. Four types of motor cycle tyres are shown—the A Won, ordinary tyre; the A Won, rubber-studded; Dreadnought, moulded on car tyre lines; and the Dreadnought, heavy rubber-studded special pattern, which is more substantially constructed than the other studded model.

PALMER TYRES, LTD., No. 3.—An innovation to be seen on the Palmer stand is a 1½ in. fabric cover for light motor bicycles made in two sizes, 26 in. and 28 in. The other models which are seen mounted on motor cycle wheels are constructed of fabric, and Airless Cord for which this firm is famous. The heavily ribbed tread which possesses such excellent non-slipping qualities remains unaltered for next year.

PETER UNION TYRE CO., No. 231.—Peter Union tyres are made in three different patterns—firstly, the ordinary standard tyre; secondly, the tyre with basket pattern tread; and, thirdly, the steel-studded leather and rubber non-skid. These covers are made in all the different sizes. A speciality is made of the puncture-proof bands and a new butt-ended tube, which, we understand, are selling in large quantities.

POLACK TYRE CO., No. 248.—Motor cycle tyres of 2 in., 2½ in., and 2½ in. section. The treads have ribs to prevent skidding, and the thickness of the rubber is up to the usual standard. Rubber and canvas belts are also shown of all the sections in use on motor bicycles. We were informed by the company's representative that these belts are made in thousands abroad, but they have not been pushed in this country up to the present. They appear to be well constructed, and should give long and satisfactory service.

Advantages of Detachable Air Tubes.

RICH DETACHABLE AIR TUBE CO., No. 255.—The Rich detachable air tube needs no further praise at our hands. Riders in all the long distance trials invariably carry a spare detachable tube, and the Rich is the one most generally used. They are most convenient in case of a puncture, as it is unnecessary to mend it straightaway, but the tube can be replaced and mended at home at leisure. There have been no improvements made for 1909, for, as Mr. Rich put it, "We find that no improvements are necessary."

SELF-SEALING RUBBER CO., No. 225.—Non-skidding tyres are shown with three different patterns of treads—zigzag, double zigzag, and ribbed. The treads look very substantial, and should give very good wear. A double-jointed tube should also be examined on this stand. We have used one of these tubes for several hundred miles on one of our machines this year, and we have found that, unlike some detachable tubes, the air does not leak away even after standing for a week or more. It is a great convenience to be able to change a punctured tube, especially on a long run, for one never knows how long a solutioned repair will last. The ends of the tube are smeared with soap-suds, and the joint is then made without difficulty. A butt-ended tube is also shown with a dome end.

STUART LOCK JOINT TUBE CO., No. 243.—A section of this detachable jointed tube was illustrated on page 901 of last week's issue. It is really a butt-ended tube, but the joints overlap considerably, and the makers claim that by this construction a burst is less likely to take place. They are made in three different qualities, and we understand the tubes have been well tested on different pattern motor cycles.

ACCESSORIES.

ASTON MOTOR ACCESSORIES CO., No. 270.—The Amac carburettor has come very much to the front during 1908, and in addition to being fitted to various well known makes of machines in the show, it is shown by the makers. Two methods of handle-bar control can be obtained according to the rider's choice, one of the methods of control being by horizontal levers and the other by vertical levers. The good points in the design of the carburettor have already been dilated upon in these pages. Amac terminal clips are also shown and numerous patterns of switches.

E. M. BOWDEN'S PATENT SYNDICATE, LTD., No. 123.—The numerous operations to which Bowden wires and levers can be put are shown to effect on this stand. We have at different times dealt with the productions of the Bowden Co., including the most recent innovation of the syndicate, which are handle-bar control levers. These are particularly neat, and should appeal to owners of existing machines fitted with tank levers. Among other interesting articles shown on the stand are valve lifters, foot brakes, rim brakes, petrol drainers, and all kinds of locking levers too numerous to mention.

J. B. BROOKS AND CO., LTD., No. 230.—The new padded top Brooks saddle is to be found on several different makes of machines in the show, which goes to prove the general popularity of this really excellent saddle. It is of large dimensions, splendidly made, and it would be difficult to find

J. B. Brooks & Co.'s Adjustable Locking Spanner.

Accessories at the Stanley Show.—

a better saddle on the market. Riders purchasing motor cycles fitted with these saddles, however, should not fail to specify to the makers their weight, so that the correct tension of springs can be supplied, otherwise they will not get the full measure of comfort. They are made in three different styles for riders of 8 to 10, 10 to 12, and 12 to 14 stones. Brooks's seat is still retained, also several other different patterns of seats and the Stratex belt. Buyers should not fail to inspect several different kinds of valises specially made for motor cycles. Messrs. Brooks have found by experience that straps are not sufficient to hold bags on to a motor cycle, and have a neat screw fixing which prevents the bags rattling loose. Brooks's patent locking adjustable spanner is an exceedingly useful tool. It remains exactly as adjusted, and is quite as firm as a solid spanner. It is sold in convenient sizes. The spanner is shown in the accompanying illustration. One turn of the lock nut fixes the jaws.

BROWN BROS., LTD., No. 265.—Autoclipse lamps and generators (two different patterns), Ducoflex belts, Hellesen dry cells, belt punches, and belt fasteners are only a few of the accessories shown by Brown Bros., Ltd. Readers in want of a really well made and reliable lamp should not fail to examine the Autoclipse. It is sold either brass finished or plated, and can be obtained either with or without the eclipsing mechanism.

E. BURT, No. 175 (Arcade).—All Mr. J. H. Greenwood's specialities for motor cycles are displayed here. The Glare headlight, original Greenwood adjustable pulley, unbreakable lamp bracket, spring handle-bar grips. All these articles have been previously described in our pages. In addition to the above accessories may be mentioned the D-All belt fasteners and Leicester switches.

A New Pattern Magneto.

THE CITY IGNITION Co., No. 166 (Arcade).—In addition to the useful electrical accessories, including the Voltoo induction coil, the following new electrical accessories may be mentioned: A motor cycle magneto machine, which is excellently made and finished; it is intended for single-cylinder and V twin-cylinder motor bicycles up to 6 h.p.; it is not a particularly light pattern, and therefore is not suitable for lightweight motor bicycles, but it is well suited for engines of 3 h.p. and over. An extremely handy push-on sparking plug connection called the Electra; the connection for the high-tension cable is very neat, and after the cable is placed in position an insulating fibre cover is screwed over the ends; when the push-on is in position no amount of vibration can possibly shake it loose.

CLISSOLD CYCLE Co., No. 105.—This firm are showing their well-known stand and non-slipping device, which has been several times previously described in our pages.

COLLIER AND SONS, No. 128.—The Matchless footrests are now rubber covered, and the Matchless adjustable belt fastener is an article which should be carefully examined by those who possess adjustable pulleys, as it provides for a big range of adjustment with great flexibility.

CONTINENTAL MOTOR Co., No. 27.—A new accessory shown for the first time in public is to be found on the Continental Motor Co.'s stand. This is the front wheel support for motor cycles. The device has quite recently been described in our pages. We may, however, remind our readers that this stand is well made and well designed. When in the working position the legs are splayed outwards, but when out of action the legs are parallel and are stowed away neatly just clear of the front mudguard. Being fitted with ball ends, a machine fitted with the R.O.M. front and back wheel stands can easily be wheeled about when the stands are in use. The well-known R.O.M. synchronised contact-breaker is also to be seen on this stand.

COUNTY CHEMICAL Co., No. 266.—Three items of interest to motor cyclists can be seen here. A new spring sparking plug terminal, which can be instantly attached and detached, a G.B. plug with three points, and samples of G.B. lubricating oil for air-cooled engines.

COWEY ENGINEERING Co., No. 117.—Three motor bicycles fitted with the Cowey speed indicator, also a hand wheel and speedometer to show the steady reading of the indicator needle. The dial of the Cowey indicator is divided up into five mile spaces reading from ten to sixty miles per hour. Each five mile space is sub-divided into miles. The driving mechanism is easily fitted to any make of machine, and,

owing to the special form of chain employed to transmit the motion from the gear to the indicator, it is capable of withstanding a considerable amount of wear. The clip attaching the indicator to the handle-bar is of strong section and a special shape, which provides a wedging action, so that it is almost impossible for it to come loose. To provide for reaction of spring forks, an ingenious little device fitted to the mechanism of the indicator allows for the radial movement of the gear wheel round the driven pinion when the spring fork comes into action. Very little power is required to drive the mechanism, owing to the freedom of the parts and the accuracy of the gear cutting.

H. J. HARDING, No. 178 (Arcade).—Numerous motor cycle accessories, including the push-on pump connections, the band brake which was described in our forecast issue, sparking plugs, free-wheel clutches, etc.

Adjustable Air Intakes.

W. AND R. JACOBS, No. 193.—A complete array of the Electary accessories, most of which have been dealt with in our columns within the last six weeks. Tricar owners should ask to see the Ara cold vulcanising outfit. White's economiser is a fitting which should be on every motor cycle carburetter, for it allows the main air intake of the carburetter to be adjusted at will. When the air intake is almost closed off there is naturally a greater suction on the jet, and on a cold morning starting is rendered an easy matter. When the machine is under way the air inlet can be opened, and more speed, and better hill-climbing obtained. We shall be surprised if a device of this description does not become general before many months are past.

J. LUCAS, LTD., No. 233.—A new motor cycle lamp has been introduced by Messrs. J. Lucas, Ltd., for 1909. It is of the separate generator type, and is splendidly finished and well proportioned. It is built on similar lines to the Lucas motor car projectors, and is fitted with a Mangin lens mirror and parabolic reflector. Its weight is 2½ lbs. The face of the lamp measures 5½ in. and glass 4½ in. The generator, which is of the drip feed pattern, has a capacity of 4½ hours. The setscrew for holding the lamp to the bracket has a lock-nut to prevent it working loose.

E. LYCETT, LTD., No. 185.—The Lightning stand has been improved and lightened considerably. A good point about this stand is that it is foot operated. The advantages of a foot-operated stand are not generally appreciated, for after a long ride on muddy roads the stand becomes splashed with mud, and when putting it in action the fingers or gloves are not soiled. Tubular carriers in different styles of finish are also shown, and form a very rigid support for a good sized touring bag. The Rawido belt is continued, also the Lyso rubber and canvas belt, which, it will be remembered, has grooves at the top and bottom. The method of manufacture of the latter belt has been considerably improved, and the makers are confident that there will now be no trouble with the ends of the belt pulling through.

LIXAVON MOTOR SOAP, No. 148 (Arcade).—A liquid solvent for cleansing the hands after undertaking dirty operations, such as a thorough overhaul of the engine.

Lightweight Accessories.

MERKHAM TRADING Co., No. 254.—The Gripple joint for quickly repairing a broken wire was recently illustrated and described in these pages. Other articles exhibited are two different patterns of spring seat-pillars for motor bicycles.

MOTO-REVE Co., LTD., No. 108.—Various accessories suitable for lightweight motor bicycles are to be seen on the Moto-Rève stand, including an electric headlight, several patterns of acetylene headlights, horns, and a new stand. This stand keeps in whichever position it is put without the aid of catches, and though light is extremely strong. This is shown fitted to a 2 h.p. Moto-Rève, finished in grey enamel.

PRESTED BATTERY Co., No. 207.—Prested ignition specialities have been added to for 1909, two new two-way switches being the principal novelties. These are positive in action and very simply constructed. It is claimed that the capacity of the Prested accumulators have been added to by ten per cent. by employing a new paste in the manufacture.

PRICE'S PATENT CANDLE Co., No. 165 (Arcade).—Occupying their old position in the arcade entrance will be found Messrs. Price's Patent Candle Co., with an attractive exhibit of the

Accessories at the Stanley Show.—

well-known Motorine, A and B oils for motor cycle engines. Copies of the judges' report on the A.C.U. Trials can be obtained here on application.

PRICE AND Co., No. 201.—Price and Co. exhibit their stands, which are now so widely used. They have been improved in the method of operation, a thumb trigger controlled by a spring being the method adopted for bringing the stand in or out of action, instead of pulling the leg of the stand outwards, as previously. The front wheel stand we illustrated some little time ago. It is on the same principle as the new pattern back stand, and can be locked in different positions, so that the ends of the legs cannot foul the magneto or silencer on some machines. The back stand is made in three different patterns for ultra-light-weights, medium weights, and heavyweight motor cycles.

W. SEARLE AND Co., No. 169 (Arcade).—Fulmen accumulators and A.V. sparking plugs.

Some Useful Accessories.

THE SERVICE MOTOR Co., LTD., No. 116.—This company are agents for a very large number of accessory firms, and on their stand in the main hall they are exhibiting a carbide carrier made by the Novdell Co., and recently described in our articles on motor cycle accessories. The Stephenson valve spring lifter is another useful article, which we described and illustrated on page 779, October 7th. The other exhibits comprise the Mabon clutch, Advance adjustable pulleys, a very neat belt carrier in leather, and a tool carrier and air-tube case fitting to the side of the machine and suspended to the main tubes of the luggage carrier. A useful luggage valise for fitting on the luggage carrier, and made telescopic on the lines of Japanese baskets, is a very moderate-priced article. It is made of rot-proof material and bound with leather. A built-up leather V belt should also be examined. This is so made that pieces can be inserted at any time to replace worn or broken sections. Prospective motor cyclists who wish to obtain a machine on the lowest possible basis—viz., free—should make enquiries regarding the L.M.C. 3½ h.p. 1909 model, which is to be given away on terms which can be obtained on application at the stand.

A. G. TAYLOR AND Co., No. 246.—The Quick-grip spanner sold by A. G. Taylor and Co. is to be found here. These handy little spanners should be found in every motor cyclist's tool kit. They have not been altered since last year as they need no attention.

Returning from a tour in France, George Newburn, the popular music hall mimic, upon being informed at Dieppe that he could not wheel his motor cycle off the boat, told the officials that wherever his motor went, he went also. Newburn had previously had his machine rather badly knocked about in landing, so man and machine were accordingly landed together by means of a crane in the manner shown

I. TERRY AND SONS, No. 206.—Springs of all patterns and descriptions are shown on this stand, but the most interesting

novelty is a new lock-nut. This nut has met with great success at Olympia, and is to be adopted by many well-known car manufacturers. Inside the nut, and behind the thread, a small coil spring is inserted, one end being fixed, and it is impossible to unscrew the nut until a spoke or thin piece of wire has been inserted in a hole provided to

Terry's Steel Folding Spanner.

release the action of the spring. A new detachable belt-fastener for motor cycles is also shown, and a handy form of pocket spanner, which we illustrate. Tennis racquet clips, rifle clips, golf club carriers, and all kinds of springs for every conceivable purpose.

Handle Starting.

TEMPLETON BROS., No. 226.—Some interesting accessories bearing the "Tee-Bee" trade mark are well worth inspection. Those riders who like the idea of handle starting can fit up an arrangement very easily on almost any machine to enable the engine to be started by means of a handle. A small sprocket wheel is clamped to the back stay, and a chain connects it to the free wheel. This handle is handy for testing purposes on machines which are not provided with pedals. A motor cycle is shown fitted up with a number of "Tee-Bee" accessories, including a combined generator and lamp-bracket, a bracket for clamping to the girder forks, another bracket for attaching the lamp to throw the light rearwards, which is especially handy when repairing a puncture or making an adjustment in the dark. A light stand, a clip for holding the high-tension wire for testing the spark, several good head-lights, D'All adjustable belt fasteners, and a tubular carrier are included among the exhibits. At the time of our visit a machine was expected on the stand fitted with a new variable gear; also a new puncture-proof tyre.

WOODGATE AND Co., No. 150 (Arcade).—The excellent Patch-quick motor patches and valve tubing. A special motor cyclist's outfit is put up containing twelve Patch-quick patches, a large tube of solution, valve tubing, etc. A special feature of the Patch-quick patches for the heavier types of motor bicycles and passenger machines are patches with a stud or strip of rubber in the centre which fills up a burst or crack and strengthens the repair.

XL ALL SPECIALITIES, LTD., No. 134.—No alterations have been made to the XL-all motor cycle saddles or the spring forks. This is sufficient proof that they are giving every satisfaction. The only addition for 1909 is a new saddle on the same principle for lightweight motor cycles. This saddle, in addition to the XL-all spring forks, has a rolling cantle. The cantle plate on which the leather at the back of the saddle is riveted is pivoted to the back of the saddle frame, and gives to each downward thrust of the rider's leg when pedalling becomes necessary. On this stand are shown the Robi patent hand shields for motor cyclists. These are handle-bar muffs lined with various materials, the outer cover being made of leather.

A Camping Outfit.

ASSOCIATION OF CYCLE CAMPERS, No. 26.—Motor cyclists who wish to avoid the expense of hotel bills will do well to make a careful inspection of this exhibit. A 3½ h.p. Triumph is shown fitted up with the camping kit packed up complete, the whole weighing not more than 23 lbs. It provides accommodation for two people, and everything necessary can be carried on the one machine. The whole kit extended and fitted up ready for use is to be seen on the stand, and when seen, it will be realised how neatly everything folds up.

THE AUTO CYCLE UNION, No. 281 (Gilbey Hall).—Every motor cyclist who contemplates membership of the Auto Cycle Union should call at this stand and interview the officials, one of whom will be in constant attendance. The Auto Cycle Union has a special scheme of insurance for motor cyclists, and full particulars of this, as well as the other benefits of membership, may be had on application.

COMPETITION RULES.

A LIGHTWEIGHT'S VIEWS.

THE correspondence following on the last open hill-climb of 1908 interested me, as showing that my long-cherished views regarding the necessity for reform are not unsupported. The weight factor is of very great importance in hill-climbs. To my mind, the principle of a minimum total weight (for machine plus rider) is one that should have been imposed years ago. Let us say that machine and rider weigh together at least 320 lbs. This would at once remove one great injustice to many aspirants for fastest time honours.

But spare us the horrors of the compulsory sandbag! At Fernhurst, 1905, my (two) sacks were the means of losing many precious seconds. Tight as hands could make them at the start, the front one was slack by the time I reached the sharp right-angled turn where one strikes the one in four portion. Consequently, as I swung to the right, so did the sandbag, with the result that I had not even a finger, let alone a hand, to spare for my control levers during the critical portion of the ride. Never again, thanks! A small quantity may not occasion inconvenience, but when the ballast weight approaches the half-hundredweight, something more compact, rigid, and incompressible becomes imperative. Lead becomes preferable to sand.

320 lbs. suggested as Minimum Total Weight.

The method of adding the weight may therefore safely be left to the choice of the rider, so long as he and his machine can be confidently certified to have competed at or over the fixed minimum weight, which might very well be tentatively fixed at the figure suggested by Mr. B. H. Davies, or, in round figures, 320 lbs.

I would go a step further. So far from pandering to the selfish few interested in the exploitation of "standard patterns"—which they themselves do not adhere to for competition work—I would accept, for competition against these "standard" machines, any obviously genuine roadster machine which conformed to the regulations of its class as regards number of cylinders, volume swept out, equipment, etc., and, together with its rider, scaled the required minimum weight. For three reasons:

1. There exists a large class of riders whose requirements are not fulfilled by any standard pattern on the market. This is evidenced by the large business and continued success of such firms as the Chater-Lea, Jap, and local assemblers. Such a rider pays willingly for an "assembled" machine which suits his views. It is obviously unfair to bar such genuine amateur owners from classes into which the maker's "tame" amateur is readily admitted.

2. It is only by the construction of "special" (i.e., other than standard) machines that progress can be made; and equally

3. It is only by the running of such improved machines against accepted standard types that the genuineness and value of the improvement can be demonstrated to the public.

I do not agree with Mr. Davies that the special engine is such a vital factor. The right sort of standard engine can easily be brought up to competition condition with a few hours' work by, or under the direction of, any

intelligent amateur. If he has bought an inferior or unsuitable article, or, having a good one, does not know what to do with it, he must not complain. He should diligently digest his copies of *The Motor Cycle*.

As a matter of fact, of the three fastest running and (upon dimensions) most powerful engines I have ever had during the many years I have been a motor cyclist, neither had a ball bearing, and only one had M.O.I.V. All were standard patterns of large manufacturers, and two were privately owned. Yet in open events the latter performed very satisfactorily, one beating its own manufacturer.

Other Details Requiring a Ruling.

A rule fixing the minimum size of tyre admissible in touring and roadster classes is badly wanted. 2 in. tyres up to 80 x 80 mm., and 2 1/4 in. above are the smallest sizes that will give reasonably satisfactory service, and even these minimum sections should only be admitted conditionally upon their being of the standard weight and pattern of their makers.

As regards carburetters, the case is somewhat different. As power producers there is nothing to choose between many of the carburetters now fitted to high-class machines; the fact of one appearing to give better results than another is simply due to the former being in a state of adjustment more suitable to the needs of the engine with which the experiment is made. This remark holds good not only in the case of float feed carburetters, but also with respect to the working valve type. The principles governing the adjustment of carburetters are well-known, and have been repeatedly set forth and explained in these columns.

That the rules controlling hill-climbs and other competitions need careful revision at competent hands is, in my opinion, beyond question. A more crying need still, however, is the provision of means for securing the proper administration of such rules, in the spirit as in the letter.

The average hill-climb prospectus contains a set of regulations which appear to provide for every imaginable contingency. Yet still competitors are dissatisfied. No wonder! Why?

The Disease.

Because the average administrative committee contains a majority of members who, however admirably they may succeed in organising the event so far as local arrangements are concerned, are absolutely incompetent to deal with the technical questions involved in the efficient conduct of what, as Mr. B. H. Davies points out, should be an efficiency competition. Time after time both in connection with hill-climbs and with track races have I seen enforced "technical" decisions which I knew to be unjust and absurd. The effect of such decisions has been the award of the prize to the most impudent trickster. Brutus, in the shape of the "technical judge," may have been in intention a scrupulously "honourable man," but the effect of his incompetence has been to defraud the deserving competitor, and to reduce the carefully prepared "rules" to chaos. The remedy lies, in my opinion, in the compulsory employment by all promoters of such events of a technical judge appointed by the A.C.U. The desirable qualifica-

Competition Rules.—

tions of such an individual are, however, much more easily scheduled than attained. In fact, when one comes to think it over it appears that he should literally realise the motto that Goethe's fiend inscribed in the student's album.

For instance, it is obviously necessary that he be a competent mechanical engineer and electrician; also that he should have had both manufacturing and competition experience. To strict impartiality he must add moral and physical courage, and a firm conviction of the mission and future of the motor cycle. He must be prepared to sacrifice most of his week-ends at the pleasantest time of the year to the discharge of duties that will often prove disagreeable, simply for the good of a sport in which he may no longer participate. In fact, in order to avoid any suspicion of partisanship,

I am safe in saying that not one of us anticipated that the effect would be to enable the makers of single-cylinder machines to say that they had "beaten" in a "race" multi-cylinder machines capable of 50% higher speed average under genuine racing conditions. Many riders who hear such statements will be totally unaware that the twin is not a mere complicated substitute for the simpler single, but is a different type with a distinct purpose, created to efficiently perform duties of a nature for which the single is ill adapted, and offering for certain purposes advantages which quite outweigh the inevitable extra fuel consumption. Surely the odds are too absurdly heavy—a few pennyworth of petrol against the status of a useful type and the welfare of an important section of the industry.

Why tinker? The R.A.C. has candidly recognised the futility of the fuel limit; has had the pluck to find

Leaders in the F.A.M. Ten Miles National Championship Race held on the 3rd inst., rounding the turn at Morris Park, New York. No. 7, Walter Goerke (the winner). No. 29, Fred Huyck. No. 1, A. G. Chapple. The winner's time was 10½ min. 45½ secs. Photo by R. G. Curtis.

I doubt whether he should even own a motor cycle—at all events, of any known make. His fee must be moderate, and therefore inadequate; nevertheless, his censorship must be free from feeling of dissatisfaction or show of arrogance.

The duties of such an official would include the inspection and passing or disqualification of all competing machines, and of any or all devices fitted to or used in connection therewith. He would hear and decide upon all appeals or references concerning the construction and equipment of the competing machines.

Lastly, I would call attention to the urgent need for reform in the Tourist Trophy regulations, as demonstrated by recent events. A serious injustice is being perpetrated against the manufacturers and entrants of the twin and other multi-cylinder machines. As a member of the committee who passed those regulations,

a safer course and run the race as a sporting event, subject only to engine limitation. Result: Thorough success—a genuine and satisfactory contest, productive of lessons of real value.

Consequently, I advocate the adoption of Mr. N. E. Drury's suggestion as regards singles; but I consider that, subject to suitable alteration of the course, the limit for the multi-cylinder class should be extended to admit the 80 × 80 mm. twins—say, 805 ccms. As a precautionary measure, it might be required that riders in the multi-cylinder class must have held a competition license for at least three years, and have competed without accident in twin classes of at least three open events.

Should not this give us a better demonstration of the comparative value of both types?

R. W. AYTON.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Touring in Norway.

[3678.]-I read Mr. Jack Kneiff's interesting letter on "Touring in Norway" in your issue of November 4th. Will Mr. Kneiff kindly place your readers under a further obligation and describe the back seat attachment he used so successfully on his tour?

W. H. J.

Keeping Mounting Pedal in Position.

[3679.]-Re hint 265 in "Hints and Tips for Motor Cyclists," I fastened a short piece of iron bolt under the left pedal, thus ensuring the pedal always being at the bottom and always flat side up. I think this better than springs, as pedals are always available for use without any alteration.

AJ 577.

The Danger of Night Riding.

[3680.]-I experienced a peculiar accident on returning after a run on the 11th inst. Turning out of a by-lane on to the main road, I was suddenly thrown from the saddle. On picking myself up (glad to say unhurt) and looking for the cause of it, I found that a telegraph wire had snapped and stretched taut across the road. Thank goodness it caught me across the chest, instead of the neck, otherwise I should not have been writing this letter.

In case of a dangerous accident of this kind, do you think a claim could be made, and if so against whom? Thanks to footrests the machine was not damaged.

N 2770

Winter Riding.

[3681.]-"Ixion" in his "Comments" of the 11th appears to be under a misapprehension. What I recommended was a pair of gauntlets with *soft* ends instead of the hard type. Perhaps I am somewhat longer in the body than "Ixion," but I have found water run down the sleeve into the glove on several occasions, and it is impossible to tuck a stiff-ended gauntlet into the sleeve end of the umbrella coat. He also comments on wind-cuff pressure, but this is largely a myth. A wind cuff should be large enough to just touch the wrist without exerting any pressure, and I for one find them necessary. It is not always desirable to use a pair of gauntlets, and in such a case the coat is useless without them.

IVAN B. HART-DAVIES.

The Life of Pneumatic Tyres.

[3682.]-With reference to Mr. Crow's letter, his experience, if it includes a year's riding, must be rather small and narrow. I did 3,000 odd miles on a nameless steel studded back tyre fitted to a $3\frac{1}{2}$ h.p. machine, weight over 200 lbs., and rider 13 stones, without burst or puncture, but not without side-slip, and have the tyre still in good condition. I have done 10,000 miles since on rubber-studded tyres, and if Mr. Crow only used them he would feel the difference in comfort and speed, and even if he rode in winter in grease, he would not need to fear side-slip or skidding. The comparison between the two both in comfort and skid are odious. A great many who ride in winter simply have a non-skid on the back wheel. This is a mistake. It should be fitted to both wheels. I ride every day, wet or fine, and in the thickest traffic and grease, and have not had a side-slip since using a rubber-studded tyre.

I certainly think that a good rubber-studded tyre should do 10,000 to 12,000 miles on a lightweight, and 6,000 to 8,000, if carefully driven, on a $3\frac{1}{2}$ h.p., weight about 200 lbs., but it depends on the man and the machine. Having to ride all through the winter to earn my living, I should not care have to go back to steel studs after rubber.

LN 3980.

Running on Benzol.

[3683.]-The real interest underlying the discussion regarding running on benzol, etc., is, I presume, the possibility of getting along when the petrol supply gives out. The following experience of mine lately on a 1908 Triumph is therefore *à propos*. When the petrol gave out eleven miles of hilly country separated me from the nearest supply. From a shop close by I obtained about a quart of ordinary methylated spirit, which carried me ten miles, and the remaining mile was comfortably covered on paraffin obtained at a wayside cottage. I found that the alcohol gave less power than petrol, and from the presence of the hydroxyl molecule in its composition it took less extra air. The paraffin, on the other hand, gave more power than petrol.

ES 224.

Magneto Manufacture.

[3684.]-With reference to Mr. J. Jackson's letter [3657] concerning magneto manufacture, as far as I know there is one firm that manufactures a real British magneto of British origin, and that is Messrs. John C. Fuller, of Woodland Works, Bow, London, E. I have not myself tried one of their magnetos, but have tried their accumulators and coils, and in my opinion I do not think there are any better. If their magnetos are like their coils and accumulators, they are a masterpiece of skill and workmanship. Their magnetos have been used on cars, and have proved very successful, having won a very big event at Brooklands this year. I may say that I have no other interest in this firm than that of a

BRITISHER.

[3685.]-We notice in your last issue letter No. 3657, signed by Mr. J. Jackson, and in reply to same we have very much pleasure in stating that not only are we a British firm making the well-known British-made Simms magnetos, but that these magnetos are adopted by a large number of the leading firms in Great Britain.

We are the actual manufacturers, and if your correspondent, or any other gentleman similarly interested, will write to us direct, we shall be very pleased to give him (or them) the fullest information concerning our magnetos, and the names of British motor cycle and car manufacturers actually using them.

There is not the slightest need to buy magnetos of foreign make when we can supply.

THE SIMMS MAGNETO CO., LTD.

The Future of the Light Tricar.

[3686.]-I regret exceedingly that I was unable to be present at what, from your report, appears to have been a most interesting and instructive paper. I notice, however, that some reference was made to the "A.C." tricar and its failure in the last Quarterly Trials. As the driver on that occasion, I think it only due to the makers that the cause of the stoppage should be known, particularly as the machine caused no small stir amongst riders for its very neat and clean design and sweetness in running. The beginning and the end of the whole trouble was a faulty coil, the trembler blade repeatedly refusing to tremble. This failure has, however, finally decided the makers to adopt magneto ignition, and they are in consequence fitting this wherever asked without extra charge.

While on the subject it may interest your readers to know that similar machines, suitably geared, and known as the "Auto-carrier," have been running, in the hands of well-known London firms, since November, 1907, with varying loads up to 5 cwts., and to the owners' complete satisfaction.

For an air-cooled engine in London traffic and this summer's temperature it is fairly evident that the question of air-cooling is simply one of design.

Trusting the above facts may be of sufficient interest as bearing on the tricar question to secure a place in your esteemed journal,
JOHN PORTWINE.

[3687].—I think Mr. A. C. Pemberton's is the nearest to the real article, but the engine should be 5 h.p., 2½ in. front tyres and 2½ in. back; the whole weight (unladen) about 150 cwt. with two-speed gear. No doubt the chain would be most serviceable, but if the belt were 1½ in. it might be then a matter of choice. All considered, I think the bicycle frame best, being less inclined to "whip," and perhaps cheaper; but the fore part should have two sets of springs, as the weight would not be much more, and springs would be of great benefit to engine and driver. For myself, I drove a 5 h.p. single-gear belt-driven tricar during 1907, and am fitting it with a Roc two-speed gear. I like a twin, but I can't keep it up to its power like the single-cylinder. One thing more, have the adjustable pulley, too; you can use up your worn belt when it "pines" through old age. I write these few lines for the working men "motorists" only. C. D.

A Well-known North Country Motor Cyclist.

[3688].—Owing to a broken piston in my 5 h.p. twin the other day, I found myself along with a friend hung up here until such a time as the necessary repair could be effected. To my surprise and pleasure whilst looking for the trouble, whom should I see approach but that well-known North of England motor cyclist, C. B. Grimshaw, by whose aid the engine was smartly dismantled and the new part wired for. I was sorry to hear from Mr. Grimshaw that he was not at Banchory on pleasure bent or on motor business, but that owing to decided weakness of one lung he was having to undergo the open air treatment for tuberculosis at the Nordrah-on-Dee Sanatorium. Mr. Grimshaw's many friends will be sorry to know that he will be away from his business for at least twelve months, and I was personally sorry to hear him state that this illness would prevent absolutely any attempts at showing the paces of his 20 h.p. machine, of which we all had such great hopes. It may also mean that motor cycle hill-climbing competitions will know him no more.

When I said *au revoir* to Mr. Grimshaw the other day he was most cheerful, and asked me to convey his compliments to any of his *confrères*. This I thought most easy of attainment through the columns of your widely read journal.

GAUTIER GUILLAUME GRIFFON.

Banchory, N.B.

Protecting Magneto Terminals.

[3689].—I noticed in a recent issue of *The Motor Cycle* a letter on "Protecting Magneto Terminals," by Mr. E. P. Waghorn, who states that after he had rubbed vaseline over the terminals he did not have a single misfire, although he was out on one of the wettest days of the year. He also states that he took his tip from the judges' report on the End-to-end Trials, which mentioned that one rider smeared his whole magneto machine with vaseline.

Now in regard to this I would like to say that several years ago I found that covers of any description were not reliable on a magneto, particularly in wet or damp weather. There was only one place where I was ever troubled with short circuits when riding in the rain or mud, which was across the carbon brush high-tension terminals, and knowing that vaseline was a good non-conductor, I adopted the plan, whenever it was wet, of smearing a little vaseline over the terminal end of the high-tension wire and all over the vulcanite carbon brush holder, and never had any trouble whatever with short circuiting. I think many of the riders in this year's End-to-end Trials can thank me for the vaseline tip; I know of several who adopted it and had no trouble throughout the run, although no one will question that there was plenty of wet and rain.

In regard to covers, I well remember one very wet day two or three years ago, when Mr. Frank Applebee arrived at Uxbridge on the morning of the Quarterly Trials, and made the remark that he did not think much of magnetos; he had just had a new one fitted on his machine, but had been troubled with misfiring from the time he left London. Considering myself quite an expert on magnetos, I went over

to his machine and examined it, and found that the magneto was well covered up with a rubber cover. Much to Mr. Applebee's surprise, I immediately began to cut away the lacing which held his cover on, removed it entirely, and then asked him to go out and ride up and down the road and see if he had any more trouble. He came back with a smile on his face, and said it ran perfectly. His trouble was simply with moisture which had collected under the rubber cover, causing short circuiting.

Whenever vaseline is not obtainable, or if one gets caught in the rain, ordinary cylinder oil smeared over the high-tension terminals on the magneto will help things for a while, but vaseline is much better, as it does not wash off or wear away with constant splashing of mud and water.

W. H. WELLS.

A Problem to be Solved.

[3690].—I have read with interest the various suggestions made as to the reason of the four-cylinder F.N. suddenly developing abnormal (!) power and jumping away, and am surprised to see that no one has yet struck what appears to me a simple solution (having had one myself). I think it is all due to the inlet valves and the larger charge entering through them at very high speeds, due to the inertia—given to the gases in the induction pipe at the beginning of the suction stroke—causing the gases to keep on flowing till the piston is on the compression stroke, and thus admitting an "abnormal" charge. Naturally this would give a very much higher compression—being a larger charge in the same space—and much more power would be developed. Of course, as every experienced motor cyclist knows, compression is almost "perfect" at high speed, even if only "good" when on the stand, and, as the originator of this discussion states, the cylinders and pistons assume a glass-like surface, setting up a minimum of friction after some usage. The strength of the inlet springs should also have a lot to do with the fast running of the engine, and if these are altered, the speed at which the "abnormal" condition takes place will be altered to a small extent. A very small lift and strong springs are, naturally, essential for speed. It is also quite possible that some lubricating oil takes part in the explosion, but this should also be at lower speeds. However, this does not appeal much to me. Trusting the above is quite plain,

A. MANNING LOMAX.

[3691].—Reading in *The Motor Cycle* a further interesting letter from Mr. Earle Ovington, I was struck with two possible explanations of the abnormal condition of his F.N. which may be of interest. In the first place, could not—as suggested in your own footnote to Mr. Ovington's first letter—the lubricating oil vaporise under the abnormal heat and add its energy to that of the petrol vapour? The loose screws in the top of the piston probably allow a little oil to leak through into the combustion chamber, and it would appear that this, rather than the fact of having bad compression, accounts for the engine's very fast running. Otherwise one might imagine that by slacking back the sparking plug in its seating, so as to allow the gases to leak past when the engine is turned slowly round, the same conditions might be induced in a four-cylinder F.N. engine as in that of Mr. Ovington whilst running at high speed.

The other explanation that occurred to me was that with a high piston speed, and the rather small inlet pipe fitted to these machines, the velocity of the incoming gases may be sufficiently great to thoroughly "pack" the cylinder with explosive mixture—on the suction stroke, of course.

GEO. H. WALKER.

EXPERIENCES WANTED.

"J. H. P." would like readers' experiences with Hayes's Jack-no-skid, used with and without a studded tyre.

"H. F." would like readers' experiences with the N.S.U. and Roc twin-cylinder motor cycles, 1907 pattern.

"Lightweight" would like readers' experiences with the Simkins pitch band drive. Can the amount of slip be satisfactorily regulated, and are there any objections to its use?

"W. G. K." would like to hear from readers who have run their machines with a two-volt coil for some considerable time. Is there any serious difference in the firing, and what extra percentage of distance can be run by using the two cells of a four-volt accumulator separately?

CYCLES FOR SALE.

h.p. Brown, ridden about 500
14 14s.—Scale, 311, Great West-
asholme, Manchester.

Triumph, 1906, 3 h.p., spares,
steed perfect, bought 1908; £23.—
Albatross Street, Preston.

1908, brand new; £44; complete,
spares; 1909 models now in stock.
s, Ltd., 74, Bold Street, Liverpool.

Rex, good condition, quantity
as, Millford castor wheel sidecar;
ild, 63, Copthorne Road, Bradford.

3 wanted, owner going abroad.—6
twin Antoine, Chater-Lea, and side-
3.—7, Beaufort Avenue, West Dids-

h.p. Rex de Luxe, Roc clutch, twin
tyres, etc., perfect condition, not run
es; £25.—1,221, The Motor Cycle Offices,
ry.

Triumph, in perfect condition, Sham-
rock-Excelsior tyres, lamp, horn, etc.;
no offers.—1,244, The Motor Cycle Offices,
try.

p. Jap, magneto, No. 6 Chater frame,
Jap patent carburetter, 2½ tyres, foot-
s; bargain, £24.—73, Plymouth Street,
chester.

HATER-LEA-JAP Lightweight, Palmer
cord, Advance pulley, very fast, climb
ything, perfect condition; £15.—67, Free-
m Street, Sheffield.

EW 3½ h.p. Phelon and Moore, two speeds,
magneto, Palmer tyres, supplied Sep-
mber, never ridden, all accessories; £44.—
otter, Blenheim Square, Leeds.

NO be sold immediately, 1½ h.p. Minerva,
good order, fast; nearest cash offers to
36 10s.—Particulars willingly, Smithies, Port-
and Grove, Heaton Chapel, Manchester.

5-7 h.p. Peugeot Twin, B. and B., handle
control, two speeds, tyres perfect, gar-
aged Southport; £25; lower power, magneto,
considered.—19, Mountfield, Prestwich, Man-
chester.

31 h.p. Minerva, B.S.A. frame, and sidecar,
complete, splendid condition, only
wants seeing, or exchange higher power, cash
adjustment; trial.—Wood, 103, Breck Road,
Liverpool.

1908 Triumph, made 13th June, 1908, as
new, perfect condition, lamp, horn,
spares, tools, etc.; approval, deposit; £37
10s.; buying 1909.—Dove, Stocksbridge, near
Sheffield.

VIBRATIONLESS Douglas Twin Light-
weights, absolutely perfect workman-
ship; inspection invited; lists free.—From
sole agents, Hitchings, Ltd., 74, Bold Street,
Liverpool.

GREAT Bargain.—3½ h.p. Zenith Bicar, two
speeds, free engine, Palmer cord tyres,
bought July, 1908; cost £60, will accept £28,
or nearest offer; trial allowed.—Evic Cycle
Co., Whittingham, Lancashire.

N.S.U., two splendid twins, 5½ and 4 h.p.,
both won several competitions, tyres
perfect, Shamrock and Palmer cord, 2½in.,
spring forks, magneto; sacrifice £25 each.—
Hughes, 16, St. John's Terrace, Leeds.

3½ h.p. Rex, 1906, newly fitted with 2½in.
Peter-Unions, Fuller Syntonic coil, two
accumulators, stand, and all accessories,
footboards or pedals; £15, or exchange for
lightweight.—Kelvey, architect, St. Annes-on-
Sea.

SHOP-SOILED 1908 Magneto Rex Feather-
weight, £19 19s.; 3½ h.p. 1908 Tourist
Rex, ball bearing engine, handle-bar con-
trol, £27 10s., unridden; exchanges enter-
tained; cash offers wanted.—Booth's Mo-
tories, Halifax.

£19 19s. 6d.—Magneto Twin Minerva, spring
forks, 2½in. tyres, nice condition. —
Booth's Motories, Halifax.

ZENITH Bicar, open frame, free engine,
enamel in splendid condition; cost
£50, accept £13 15s.—Booth's Motories, Hal-
ifax.

MINERVA and Rex.—We carry the largest
stock of spare parts in the provinces
for these machines, can deliver new ma-
chines from stock at low prices; cash, ex-
change, or gradual payments; charged ac-
cumulators for hire, 1s. per week.—Cookson
Bros., 511, Chester Road, Old Trafford.

FLITTING.

Prior to removing to our new Works, LOW CASH
OFFERS will be welcomed.

SHOP-SOILED, UNRIDDEN.

3½ h.p. REX TOURIST model (1908), mag- neto, ball bearing engine, handle-bar control listed at 38 guineas	£27 10
5 h.p. REX TWIN TOURIST (1908), mag- neto, ball bearing engine, black and gold, listed at 43 guineas	29 10

RUBBER AND CANVAS.

Correct angle. Non-stretching. Very clean.
3in. 9d., 3in. 11d., 3in. 1/2, 3in. 1/5.
Approval. Sample free.

CORONET VARIABLE
SPEED PULLEY.

14/- each.

Special Terms to the trade.
Standard makes can be had with ut
sending old pulley for pattern.

The screwed flange is securely held in any position
by a simple yet ingenious contrivance that distin-
guishes it as the most improved pulley made.

GRIPSKIN BELTING.

Scientifically made from selected parts of hides.
An efficient belt at a popular price. Outlasts two
rubber belts. Correct angle, perfect drive, non-
stretching. We send on approval on receipt of P.O.

3in. 9d., 3in. 10d., 3in. 1/5, 3in. 1/1.
Special Terms to the trade.

Booth's Motor Exchange,
CORONET WORKS, WADE ST., HALIFAX.

MOTOR BICYCLES FOR SALE.

13 h.p. Werner, lightweight, vertical en-
gine, low frame, perfect running order,
tyres good, accessories; sacrifice £4 10s.—117,
Duckworth Street, Darwen.

HALIFAX.—As the largest dealers in Rex
Motors we can offer the following
shop-soiled machines; 1908 Rex, magneto,
featherweight, £19 19s.; 1908 3½ h.p. magneto
Rex, ball bearing engine, £27 10s.; 1908 twin
Rex, £29 10s.; 1908 3½ h.p. Rex de Luxe, Roc
clutch, two-speed, £31 10s.; also a few brand
new, offers wanted.—Halifax Motor Ex-
change, Westgate, Halifax.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire
Derby, Stafford, Shropshire, Mont
gomery, and Merioneth.

21 h.p. Minerva, equal to new; £10 for
quick sale, worth double.—38, St. Paul
Street West, Burton-on-Trent.

TRIUMPH, 1906, magneto, 1908 spring forks
footrests, butt-ended tubes, fine condi-
tion; £22, bargain.—Hall, Richard Street
Northwich.

6 h.p. 1908 N.S.U., climb anything; cos-
t £54 four months ago; any trial; like
new; £28 cash.—Dallaway, Fruiterer, Cape
Smethwick.

MINERVA, 3½ h.p., springs, Brown and Bar-
low, Premier, footboards, horn, stand
carrier, and tools, perfect as new; £29.—
Trott, Shrewsbury.

TRIUMPHS, 1909, any make taken in ex-
change; liberal allowances; make ap-
pointment to see me at Stanley Show.—
Parker, Melbourne, Derby.

MOTO-REVE, latest model, not run 10
miles, absolutely new condition; cos-
t £41; extra Clincher tyres, accessories; take
£30.—Lamervue, Lloyd Street, Llandudno.

5 h.p. Vindec Special, just overhauled, in
perfect condition, Truffault forks, new
Shamrock Excelsior on back, horn, tools
spares, etc.; £29.—W. Bunney, Prenton, Birk-
head.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland
Northamptonshire, and Warwickshire.

ZENITH Bicar, Palmer tyres, Fafnir 4 h.p.
engine; great bargain, £15 10s. — 12
Bull Ring, Birmingham.

23 h.p. Excelsior, good going order, large
stand; £7 10s. cash, or best offer.—H
White, Fenny Compton, Leamington.

1908 Triumph, 3½ h.p., new in August
scarcely used, lamp, and all spares
price £35.—Guyver, Stratford-on-Avon.

BRADBURY, 3 h.p., spray carburetter
Clincher A Won tyres, low built; grea-
bargain, £10 10s.—12, Bull Ring, Birmingham

23 h.p. Excelsior, vertical, spray, working
order; £7 10s.; typewriter part ex-
change.—Henson, 16, James Street, Grantham

EXCEPTIONAL Offer.—3½ h.p. Rex, guaran-
teed perfect, condition as new; bar-
gain, £15.—57, King Richard Street, Coven-
try.

5-6 h.p. Twin Rex, M.O.V., splendid condition
3in. Whittle belt, spring forks, and seat
£25, or exchange 7-8 h.p. Minerva. — G. H
Hooke, Monumental Works, Erdington.

LOYDS' 2½ h.p., in good condition, new
non-skid tyre, Brooks saddle, and three
batteries, with numerous accessories; £10.—
Buxton, 604, Bearwood Road, Smethwick.

TWIN-CYLINDER Rex, magneto ignition
Amac carburetter, handle-bar control,
spring forks, cantilever saddle, perfect run-
ning order; exceptional bargain, £19 10s. —
Lloyd, Victoria Terrace, Leamington.

F.N., 5-6 h.p., latest model, five weeks old
perfect, not run 400 miles, 2½in. tyres
rubber studded back, spring saddle, stand
Rushmore model, lamp, tools, all spares
£45, lowest.—West End House, Geddington
Kettering, Northants.

1908 3½ h.p. Triumph, T.T., handle-bar con-
trol, Clinchers, Dermatine, and two
spare belts, lamp, and generator, also spar-
lamp, Cowey speed indicator, spare valv-
and cover (Palmer), in perfect order; an-
trial or dismantlement; can be seen and
tried by appointment.—J. W. Willson, Burgh-
R.S.O.

MOTOR BICYCLES FOR SALE.

7-8 h.p. Minerva Motor Cycle, 1908, and Ariel sidecar, accumulator ignition, Continentals, Lomax non-skid, numerous spares; living up motoring; £30 the lot.—Vic. Johnson, Osborne Road, Erdington, Birmingham.

23 h.p. Brown, in thorough good order, low frame, 26in. wheels, Duco non-skid, Clincher A Won front, girder, vertical, M.O.V., Longuemare, plain coil, long handlebars, stand-carrier, start cold half-turn of pedal, the best cash offer; for exchange, 12 h.p. Minerva, inclined, in sound running order, F.N., Dunlops, will take two decent push bikes, no rubbish; also enamelling oven will take three frames), with lamp, also one large De Dion coil, plain, sound, will take leather jacket, or good motor gas lamp, or anything useful.—Downs, Holbeach.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

23 h.p. Kerry, reliable, splendid condition; £14.—Gus. Brown, St. John's Street, Bedford.

FOR Sale, 1907 Quadrant, spring forks, fine condition; £24, or near offer.—Box No. 3,624, *The Motor Cycle* Offices, 20, Tudor Street, E.C.

21 h.p. Brown, good condition, new Palmer tyres, splendid hill-climber, tools, etc.; £12, must sell.—Gifford, Hadderham, Cambs.

EXCELSIOR, 4 h.p., Longuemare, long bars, low, 2in. new tyres, perfect condition, very powerful; £11 15s., bargain.—Gordon, Bassingbourne, Royston, Cambs.

21 h.p. Minerva, magneto, spring forks, 21 faultless throughout, very fully equipped, with every refinement, requires nothing spending on it; accept £20.—Young, Ipswell, Cambs.

TRIUMPH, 1907, Nala two-speed, and Auto-phæton two-wheeled sidecar, coach-built; 40 guineas, or sell two-speed and sidecar separately, condition as new.—Sid Spaul, Castle Hill, Norwich.

SECTION VI.

Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

26—Minerva, 2 h.p., spring forks, spray, Dunlop tyres, rubber belt, long handlebars, numbers, in good running order.—Apply, Page, 14, High Street, Bewdley.

5 h.p., £16.—Single Buchet, in Chater frame, brass torpedo tank, two accumulators and switches, spring forks, new Palmer and hamrock tyres, footboards, comfortable and reliable.—27, Thornwood, Treharris, Glam.

23 h.p. Ariel, M.O.V., splendid condition, 24 enamelled French grey, Dunlops, Brown and Barlow carburetter, new 20 amp. E.P.R. accumulator, footrests, spring forks, long handle-bars, P. and H. lamp, thoroughly overhauled; rare bargain, £15. — Sankey, Kingsland, Herefordshire.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, and Channel Islands.

REX Featherweight, 2½ h.p., magneto, new; 21 guineas.—Sansom, Lynchford Road, Barnborough, Hants.

8 h.p. Triumph, magneto ignition, splendid condition; £25.—Willway and Sons, Ltd., St. Augustine's, Bristol.

5 h.p. Vindec, 1908, two speed, and Montgomery sidecar; particulars; £43. — Freig, Penside, Nailsworth, Glos.

OTTO Motor Cycle, 2½ h.p.; bargain, £6 10s.; good going order.—W.L., 139, Adelaide Road, St. Denys, Southampton.

21 h.p. Minerva, built with B.S.A. frame, 22 Palmer tyres (unpunctured), splendid condition; £18 cash.—Eyre, Zeals House, Zeals, Wilts.

21 h.p. Minerva, pair non-skids, spare belt, lamp, and horn, in splendid condition, reliable; £15 10s.—P. H. Breeze, 74, High Street, Aldershot.

5 h.p. Fafnir Engine, B.S.A. frame and fittings, Dunlops, just overhauled; £9, a bargain.—W. H. Breeze and Son, 74, High Street, Aldershot.

Now is the Time to Buy.

FOUR 3½ h.p. QUADRANTS.
B. and new, 1908 machines, magneto ignition, £48 or exchange.

FOUR 5½ h.p. MAGNETO TWIN REXES.
Spring forks, cantilever seats, £22 each or exchange.

FOUR 3½ h.p. RE ES.
Vertical engines, spray carburetters, 22in. frames. £10 each or exchange.

VALUE FOR MONEY.		
5 h.p. Four-cylinder HOLDEN	£16	0
5-6 h.p. 1907, magneto, TWIN REX, black and gold	£22	0

ADDRESS—20, TUDOR STREET, LONDON, E.C.

Carburation.

A CORRESPONDENT writes an interesting letter to the "Letters to the Editor" columns this week regarding carburation, and suggests that motor bicycles should be provided with carburetters fitted with two jets, one with a large hole to give the utmost power for hill-climbing and another smaller one for use at ordinary touring speeds in level country and for slow running in traffic. Most motor cyclists know that machines which are ridden in hill-climbing competitions are usually provided with as large a jet as it is possible to use to obtain the greatest amount of power from the engine. But a large jet is not suitable for average touring conditions, yet on steep hills would be distinctly advantageous. The suggestion made by our correspondent could be very well carried out somewhat on the lines of the device described by "Ixion" in "Occasional Comments" on May 13th last, and which could be fitted easily to any existing carburetter without entailing any great amount of structural alteration. With the device in question the same float chamber can be used, and all that is necessary is another jet and smaller inlet pipe with a practically fixed air supply. This can be so adjusted that it will run a motor cycle at almost any desired maximum speed up to, say, twenty-five miles an hour, and when an exceptional hill is encountered the auxiliary carburetter jet would be uncovered and the extra air brought into play, giving a much greater range of speed and power. The large jet could also be used for starting. Failing this arrangement being satisfactory, the carburetter would have to be divided into two separate chambers with separate additional and fixed air supplies and throttles—an arrangement

that would be hardly as good, because it would be necessary to part with existing carburetters. The same result might be arrived at with a variable jet, but the manipulation of a variable jet would not be so simple, because varying the supply of petrol is always a much more sensitive method of controlling the mixture than varying the air supply.

Riding Position.

WE cannot pass over the exhibits at the Stanley Show without making reference to one item in connection with the design of motor bicycles, which appears to us to be a retrograde movement, and that is the importance of distribution of the weight. We think it is a generally accepted axiom that the more the weight can be centralised between the two wheels the less liability there is for the machine to side-slip on greasy surfaces, and the more comfortable it is to ride. Now it is not always easy to obtain this desired position for the rider without making a very low frame and somewhat curtailing the tank capacity. In fact, a considerable amount of ingenuity is required to provide for a low saddle position, a fair petrol capacity, and easy removal of the cylinder or cylinders. To overcome these difficulties we noticed one or two machines at the show on which a low riding position has been obtained at the sacrifice of the central position for the rider. This has been done by attaching the saddle to a pillar extending from the top tube, bringing the rider nearly over the centre of the rear wheel. With the saddle so placed the road vibration from the driving wheel is much more noticeable, and if a skid does take place our experience is that it is more difficult to counteract than when one is seated between the wheels.

Roadster Motor Bicycles at the Stanley.

By B. H. DAVIES.

NOTHING struck me more forcibly at the Stanley Show than the unobtrusive nature of the 1909 improvements on the highest grade machines.

These machines have already attained such a degree of perfection that unless some startling innovations such as the Silent Knight engine, revolutionise the trade, the makers of the half-dozen best machines will be hard put to it to discover what their travellers "talking points" for 1909; and even at last year's show most well-known machines displayed few fundamental differences from '08 models, although the modifications all make for increased comfort and efficiency.

Piston and Carburetter Improvements.

Two of the less obvious but very valuable improvements concern the piston and the carburetter. I do not know how far the domed heads now fitted on all pistons, such as the Triumph and Rex, are going to be of real benefit, but I am quite certain that the L.M.C., Rex, and Triumph devices for reducing wear of the cylinder walls will result in greatly prolonged maintenance of power. The practice of fitting one ring on the lower end of the piston actually provides an extra bearing for the piston side upon, at a point where such a bearing was very needed. In the past I have often found considerable wear in the upper part of the bore after as brief a distance as 5,000 miles. With these three pistons the amount of wear after 20,000 miles will not be excessive, and, in addition, it will be evenly distributed through the entire range of the piston's stroke. I heard several riders complaining that *two* rings ought to have been retained at the top of the piston to prevent leakages through the slots of the rings, but they

had evidently not noticed that the rings are step-cut, and one step-cut ring is as good as two obliquely-slotted rings any day. This design of piston will be widely copied on cars.

Turning to carburetters, handle-bar control is uniformly standard for the first time, and, generally speaking, great strides have been made in carburetter construction. The Brown and Barlow and the A.M.A.C. share public favour almost evenly, and are found on practically all the roadster machines staged. Both alike are extremely accessible, give a high degree of maximum power combined with excellent flexibility, and are free from the multitude of "twiddly bits," which disfigured ancient carburetters and caused frequent trouble by falling off or getting out of order. Personally, I prefer the B. and B. type of handle-bar control (which gives a sweeping motion of the levers in the horizontal plane) to the A.M.A.C. device, which affords a radial movement in the vertical plane; and I notice the Rex Co. have fitted levers of the B. and B. type to the A.M.A.C. carburetters on their 3½ h.p.

Triumph and Rex Notions.

The Triumph has a peculiarly smart notion in the way of a revolving spout to the petrol tank drain tap. Turned towards the rear of the machine, the petrol flow is cut off, but when the spout is turned forward it comes just over the compression tap, and the petrol cock is then automatically open. The Rex Co. have a device serving the same end, but their drain tap stands just over the compression tap, and will be fitted with a fixed spout. It is hard to guess where the Triumph people are going to find any more improvements for 1910; their machine is just about perfect. Much the

same applies to the Rex, who are among those sensible firms who are returning to a lower compression. The demands of a minority of amateurs, those who thirst for speed up hills, have led to the infliction of an ultra-high compression engine on the rest of us. Such engines easily suffer from pre-ignition, are difficult to start, gum up very readily, knock badly at the least provocation, and are not at all flexible when slowed down around corners or on up-grades. The Rex Co. will, no doubt, continue to supply high compression engines to special order, but their standard tourist engine is low compression and very flexible. The Triumph Co. meet this difficulty by listing racing and roadster patterns with different compressions.

h.p. twin-cylinder Norton of up-to-date design. This machine has handle-bar control, Druid spring forks, separate silencers, adjustable pulley, and rubber-studded tyres.

Two views of the 32nd Stanley Show at the Royal Agricultural Hall, Islington, N., showing a few of the stands on the ground floor on which complete motor cycles were staged.

Roadster Motor Bicycles at the Stanley—

I noticed on the new Rex an ingenious timing gear with only two pinions, an excellent front wheel mudguard, enclosed front fork springs, connecting rods beautifully machined all over, quick detachable front wheel, a driving fit gudgeon pin with $\frac{1}{1000}$ in. taper, oil pump inside tank, and last, but not least, hinged brake clips on the rear chain stays, allowing the back wheel to be removed without damage to the enamel. The Rex, in common with several other machines, has now a horizontal quadruple coil in the petrol feed pipe, reducing the chance of a broken pipe to the minimum.

The Flat Valve Quadrant Engine.

The Quadrant Co. have something really good in their new engine—the first motor cycle engine, I believe, to imitate the flat-faced valves so long in use on the Mercedes cars. Anyone who has owned or managed an engine of this type will be aware how long the flat faces remain gas-tight. Another detail I much liked on the Quadrant was their specially adapted

ordinary plugging up long rises, thanks to an excellent flywheel system, and the 1909 type promises to reproduce this precious characteristic, besides being completely equipped with refinements as any motor in its class.

The Roc is much the same as ever. I particularly noticed the m.o.v. twin-cylinder engine, which many riders infinitely prefer; the duplex tanks, rendering petrol supply troubles impossible; the new Cee spring fitted at the base of the front forks to cushion shock at any angle; and the brass-studded metal to metal band brakes, an ingenious notion for securing a gentle operation.

At three stands I was unable to interview the man in charge, and detected few alterations unaided, viz. N.S.U., Minerva, and Brown. All this trio looked good as ever, and all hold magnificent records in public tests. In particular, I was glad to see the Minerva people have returned to the magneto on their twin cylinders, while their 8 h.p. is distinctly a lightweight at 180 lbs. The 4 h.p. N.S.U., with double crank

Two handsome single-gear pedalled motor bicycles at the Stanley Show.

The new 3½ h.p. Humber, which has a live axle, so that the engine can be started when jacked up by means of a handle. Note the new design mud-flap, position of toolcase, and Brooks padded-top saddle.

The 1909 15 h.p. twin-cylinder Tourist Trophy Vindex, which, like all other models of the same make, is finished in Vindex grey. The carburetter is now fitted between the cylinders.

B. and B. carburetter. The control is ingeniously reduced to a single lever, as the piston throttle works an air slide in due proportion to its own movement. The objection to such single lever controls is that no fixed air opening can possibly suit all weather conditions; hence the air opening on the Quadrant is fitted with an external slide carrying a button. At the start of a run this button is set by hand to increase or reduce the aperture controlled by the piston, so here we have a carburetter which is fairly accurate under all conditions, provided the hand button is once correctly set to suit the weather. In other respects, the Quadrant is thoroughly up to date, and promises to resume the high position it attained in 1906.

The L.M.C. machine is practically unaltered from this year's type, but if the engine exhibited as having covered 18,000 miles is a fair example of the way these engines wear, they must be hard to beat, for it was in splendid condition throughout. The automatic spring pulley recently illustrated in *The Motor Cycle* is another feature of the exhibit.

An Old Friend with a New Face.

The Bradbury is an old friend I welcome again in a very up-to-date form. I have not ridden a Bradbury for some years, but the early types possessed the steadiest engines on the market, capable of extra-

shaft bearings and dimensions of 82 mm. bore and 105 mm. stroke, will have a big vogue.

Four Unique Novelties.

The Norton piston lubrication should be studied being quite unique.

The Vindex exhibit was hailed with delight by the riders who have been demanding a 9 h.p. of light weight and the highest class; previous 9 h.p. machines have usually been too weighty for most of us. The exhibit comprised three novelties—all unique, and all essentially desirable. The first was an automatic inlet valve, adjustable for lift and strength of spring, and devoid of cotter, three desiderata obtained by threading the cup on a screwed stem, and employing a locknut. The handle-bars are fitted with a double adjustment so that they are adjustable for angle of slope as well as for height. And, finally, the silencer is really good. The portion of the exhaust pipe contained in the silencer is slotted instead of perforated, so that the area of emission is double the inlet valve area, which makes for silence and efficiency. In addition, half of the circumference of the silencer, namely, that half on which the gases impinge as they issue from the pipe, is lined with asbestos card, so that metallurgical "ring" is done away with. In other respects the Vindex are as practical and refined as we should

Roadster Motor Bicycles at the Stanley—

expect from a firm which has as one of its directors one of the keenest and hardest riders on the road.

The Bat machines remain practically unaltered, the 6-7 h.p. T.T. type being one of the lightest of its power on the market. The Bat firm have a special reputation for tuning up machines thoroughly before delivery, and

A machine which performs very consistently in all competitions is the $3\frac{1}{2}$ h.p. two-speed P. and M., the 1909 edition of which we illustrate. It was one of the few chain-driven bicycles at last week's Show.

for meeting the requirements of individual customers. As a sample of what they can do in this line, they staged a twin intended specially for sidecar work, with a P. and M. gear driving a huge counter-shaft belt pulley set well forward of the engine, and with a final belt transmission.

Two-speed Gears and Light Frames and Wheels.

The Phelon-Moore is a little lighter, and now has the low gear outside, with the starting handle mounted on it, so that a handle start is an easy matter, in spite of the magneto ignition. I hear some riders condemn this machine as heavy. The public must understand that the strength of all parts must be increased if a two-speed gear chain drive is to be safely fitted, and that if a two-speed gear and chain drive were fitted on a high-grade $3\frac{1}{2}$ h.p. light roadster serious troubles would soon be encountered—*experto crede!*

The F.N. four-cylinder evinces no alterations, and does not call for any.

The Premier is the best and prettiest first machine I have ever inspected. One would imagine the firm had ten years' experience behind it. It is in all respects a first-grade light tourist. The makers offer a very liberal guarantee, viz., that every machine sent out will do from four to forty miles per hour on the flat, and carry a second passenger up a one in seven grade.

As the James has already been fully described, I will leave it with the single remark that I never thought I should live to see a motor bicycle on which the wheels and tyres were as accessible as those of a car.

A Machine Bristling with Good Points.

The Humber Co. are returning renegades, but there is more pride than penitence about the aspect of their exhibit, and Johnny Crundall is obviously glad to be returning to his first love. Everyone hastened to have a look at it, so I will only remark on one or two points. The valve-lifter is operated by light steel rods, in preference to flexible wires. The tank and feed pipe are

in duplicate. An excellent point is the foot lubricating pump, and I only wonder no one has brought this out before, as it dispenses with all need to remove the hand from the grips, and there is no fiddling two-way cock. At the same time, I should prefer to see the oil tank removed to a position where it could not be damaged by a side-slip. The toolbag is neatly stowed away in the angle between the bottom of the carrier and the top of the mudguard, where it is perfectly accessible and cannot interfere with luggage capacity. The machine bristles with good points, and a greatly improved edition of a well-designed two-speed hub makes a most attractive extra.

One of the most attractive newcomers to the Stanley was the Zenith motor bicycle, which readers should carefully distinguish from the sprung frame Zenette. It is simply a standard, high-grade, lightweight $3\frac{1}{2}$ h.p. tourist roadster, with the Gradua gear as a special feature. Riders are familiar with this gear, which consists of an expanding engine pulley, the belt slack being taken up by revolving a hand wheel, which wheel by means of a gear and slides causes the rear wheel to vary its distance from the engine. The device affords no less than 164 different gears, and therefore the Zenith is probably the most efficient hill-climber on the road.

I noticed one grievous fault on many machines staged, namely, a return to the ancient, inefficient, and very troublesome external band brake; and one common improvement, the substitution of the excellent Druid spring fork for various harsh and heavy devices formerly popular. Finally, one is glad to see cream and grey enamels, which do not show dust and mud, gradually replacing the standard black, which only looks well when it is perfectly clean.

THE LIGHT-WEIGHTS.

Three popular lightweights—the Motosacoche, the Moto-Rêve, and the Douglas—presented a less juvenile appearance at Islington than when I last saw them. They are each twelve months older, and not one of them but has

learnt a good deal in that time. An extra shade of strength in tyres or rims here, a freshly designed brake there, and other details prove that they have been ridden hard and jealously watched in the riding, and I have no hesitation in saying they are a magnificent

The novel arrangement of the radiating fins on the James engine.

Roadster Motor Bicycles at the Stanley—

trio, destined to make many new friends in 1909. I have a lot of absolutely new lightweights to deal with, so I shall give our old friends short shrift for the nonce. I only wish to draw attention to the twin-cylinder Motosacoche pattern, which only weighs 5 lbs. more than the $1\frac{1}{4}$ in return for its additional h.p., and

Two new J.A.P. engines for 1909. (1) A 4 h.p. single-cylinder engine, and (2) a twin-cylinder V type engine, cylinders 85 x 85 mm. with mechanically operated valves at the side.

to say that the lady's Motosacoche, plus a strong pedal cycle gear in the rear hub, will fill a gap that has been empty since motor cycles first came in. My old friend the Moto-Rêve looks more workmanlike than ever in a grey finish, and with the addition of a Watawata belt, zin. tyres, and a handle-bar control of the extra air will take a lot of beating. The Douglas is also improved, and, while considerably reduced in weight and showing a greatly improved frame, remains the most powerful member of its class.

My eye was early caught by what looked to me suspiciously like the ideal lightweight—the last word in its line. I mean the $2\frac{1}{4}$ h.p. F.N. True, it is 40 lbs. heavier than some of its little sisters, for it scales 120 lbs., but even a Dursley-Pedersen man would not call that too heavy. It is a sturdy little youngster throughout, and if I want a lightweight to travel at motor cycling speeds, I do not desire to find a lot of push-bicycle fittings masquerading as motor stuff, so that I am not sure the slight increase in weight is not purely meritorious. What I particularly rejoiced in was the weatherproof transmission and the two-speed gear. We might suspect a shaft drive that issued from a factory that had previously clung to the belt, but the F.N. people have shown us that they know how to make a safe, smooth, and efficient drive of this type, and here

it is in miniature. There will be no accusation of belts slipping in wet weather urged against this machine. My heart was wholly won when I examined the neat little leather to metal cone clutch and the sliding two-speed gear, affording ratios of 6 and 10 to 1. I might add that this gear is foolproof. The gear lever has a trigger, and is immovable until the trigger is pressed up towards the gear handle. But this trigger takes out the clutch. *Voilà tout!* Other interesting items in the specification are a universal joint, to meet frame torsion, and a complete handle-bar control. The only point I disliked was the utilisation of the left footboard to apply the brake, but that is the merest detail. No doubt when familiar with the machine no one would be likely to apply the brake in stepping on board with the engine under weigh. I take off my hat in sincere admiration to a genuine lightweight that can climb any hill, and is ignorant of all transmission troubles.

Equally novel, and deserving the name "freak" in a strictly Pickwickian sense, devoid of aspersion, was the $2\frac{3}{4}$ h.p. L.M.C. Previously I have only seen air-cooled motor cycles with cylinders as smooth as the palm of my hand and japanned a neat black all over in my milder nightmares. But a 105 lb. machine that can take a 10 stone rider up Birdlip will have to be reckoned with, so the L.M.C. may prove its worth very shortly, when next year's trials come round.

The Wolf was shown in several forms, the biggest being a 4 h.p., which only scales 116 lbs., and the smallest a seventy-pounder $1\frac{1}{2}$ h.p. The Wolf is one of those machines which has not so far been conspicuous in open competition, but enjoys an enormous popularity among those who know it. The staging of so many models doubtless denotes the inauguration of a more ambitious programme, and we shall probably hear more of its performances next year. The machines are certainly well made and attractive.

I was again pleasurably surprised to encounter an up-to-date edition of the $2\frac{1}{2}$ h.p. J.A.P. engine, which

Another newcomer. The $2\frac{1}{2}$ h.p. Corah-J.A.P. lightweight bicycle, fitted with Ruthardt magneto, B. and B. handle-bar controlled carburetter, and spring forks. (See page 947.)

Roadster Motor Bicycles at the Stanley—

gured on a Bat, Matchless, and Corah lightweight. The Bat weighs 100 lbs. (By the way, it is curious that the weight of a motor cycle always works out exactly in round figures; it shows how these engineers can only dream in the metrical system.) This weight includes the famous Bat spring frame (a fitting which a lightweight needs far more than a heavier roadster), large tanks, sturdy fitments throughout, and 2in. tyres—the minimum section permissible, to my mind. The engine alone is sufficient to guarantee satisfaction with these machines. I managed to miss the Corah, probably because there was such a wealth of good things on the

Service stand, but I like the weight (100 lbs.), I like the power (2½ h.p.), it is a J.A.P. engine also, and I applaud the tyres (2in.) I have no hesitation in saying we shall find a little fleet of lightweights well up with the van in the next 1,000 miles trial. The Moto-Rêve, Motosacoche, and Douglas are sure to be there, probably represented by three riders apiece, as I hear of several competition riding amateurs to whom the sporting side of a small engine appeals. Then if the F.N., Matchless, L.M.C., Bat, Wolf, Corah, and N.S.U. desire public laurels in addition, we shall see great excitement; and I should not dare to tip an out-and-out winner.

THE MONKEY-ON-THE-STICK POSITION.

UNDER the above heading *The Bicycling World and Motor Cycle Review* of America recently published a leaderette on the riding position adopted by motor cyclists, pointing out the absurdity of placing the saddle over the back wheel and fitting long handle-bars to suit. This is an old subject, and one which we dealt with three or four years ago, when the practice was indulged in to a small extent in England. But low frames have been standard on British machines for quite three years, and even the most casual observer notices how much more attention British makers pay to the rider's

attitude (the italics are ours), has stated that he never saw a lot of motor cyclists who were so thoroughly tired, though they had no sand to contend with. He attributed their condition solely to their unrestful and unscientific saddle position. He himself had assumed a 'happy medium,' and, without intending conceit, he believed his comparative freshness was due to the fact."

A more groundless statement one could not imagine, for it is a fact that the American motor cycle in the End-to-end run was one of the two or three machines which was not designed for a really low saddle posi-

WHICH IS THE MORE NATURAL RIDING POSITION?

An End-to-end competitor on a typical British machine, giving a natural and comfortable riding position. An American journal tells its readers that the English riders were "done up" at the end of each day's run, owing to the "unrestful" riding position they adopted.

comfort than the average foreigner does. Consequently the following extract from the journal referred to will, we predict, cause many a hearty laugh in English motor cycling circles:

"When they could be induced to tell the whole truth, even some of the experts who participated in this year's endurance contests and who aped the monkey on the stick admitted that they were never so wearied or so badly 'done up.' The American who competed in the British six-day contest, in which practically all of the participants affected the silly

The American competitor instanced by the New York journal, photographed at John-o'-Groat's. This rider is said to have been fresh at the end of each day's run, owing to his natural riding position. (See the accompanying article.)

tion, and consequently a special saddle pillar extending over the back wheel had to be adopted to give a low riding position. Nearly all the English competitors used machines designed in the first instance to give an armchair-like and comfortable position, and a natural position can only be obtained by the use of footrests. We leave readers to draw their own conclusions from the accompanying illustration of one of the British competitors in the End-to-end Trial shown alongside the American competitor who is stated to have given utterance to the remarks quoted.

An Analytical Abstract of all Motor Cycles
Exhibited at the Stanley Show, 20th-28th November, 1908.

OCCASIONAL COMMENTS.

By "IXION."

Finality.

Finality is a word one hesitates to write in connection with any progressive and highly competitive industry, but a friend of mine met me at the Stanley and complained there were no 1909 alterations. He had not a very trained eye to aid him in his search, but my own close inspection revealed a host of valuable innovations; but the majority of them were of a type that would not reveal themselves to a casual glance. For example, the new pistons on the Rex and Triumph might easily have been overlooked, and yet they will spell greatly increased efficiency for 1909. If we may not use the word finality with any real accuracy, we may at least say this much: the 3½ h.p. tourist roadster has settled down into accepted outlines, and will not experience any radical alterations until some genius comes along with a revolutionary invention. The twin-cylinders are in a less fixed state of development, but are becoming gradually lighter, while the lightweights are still very much on the move, and, as judged by the more prominent samples, have touched a very high mark indeed. They are incredibly neat and efficient.

Colour Finishes.

I for one was very pleased to see a slight but well-marked tendency to renounce the standard black and silver finish. We all know that nothing can look smarter on a show stand—it is the frock coat and top hat of the motor cycle—but we do not go for pedestrian tours in silk hats and frock coats; neither should the motor bicycle face touring conditions in review order. I was greatly taken with the various grey and cream finishes exhibited on several stands, notably the Vindec and Moto-Rêve, and if less brilliant on a show stand than the regulation black, silver, and aluminium, it was considerably more workmanlike. I for one am almost decided not to ride a black and silver finished machine if I live to buy a 1909 model.

Slump.

I fancy even the most virulent of the anti-motor dailies will have to summarily dismiss its ill-informed babblers, who constantly prate of motor cycling as a momentary and already declining craze. There were over two hundred complete motor cycles at the Show—a fact which in itself proves a healthy demand. One great firm made its bow in the trade—the Premier Cycle Co. Another—the Humber—after several years of abstention; during which it has won great success in more ambitious fields, returned to the fold as a shame-stricken recanter of former doubts, long since proved foolish and unworthy. And, finally, quite a number of riders say their last year's mounts were good enough for anything, and they are far too grateful to sell them, so that quite an unparalleled bulk of the 1909 business is being done with men who have never previously owned a motor cycle of any kind. There is no branch of the motor industry on such a healthy footing at the present moment as the motor cycle trade.

The Tricar of the Future.

I thought the most significant point elicited at the recent A.C.U. discussion of the tricar question was the satisfaction which two of the speakers expressed with the very simplest and lightest type, the actual

pattern they had used being a 2¾ h.p. Excelsior motor bicycle with a Mills and Fulford forecar bolted on to it. Mr. Pemberton had run one of these for five years, and since fitting a Phoenix gear to it had no other complaints than its discomfort, especially with the chair empty. Mr. Davies early abandoned his similar machine in favour of a more complicated type, but he frankly said that a machine of this type, plus better springing, larger tyres, and an emergency gear, made a very sporting little passenger machine indeed. Pending the standardisation of an up-to-date tricar, three-wheeler enthusiasts might do a good deal worse than bolt a good sub-sprung forecarriage on to any sound two-speeded bicycle. Readers who only possess experience of the early forecar with a rigid frame should remember that the addition of extra springs over the front axle goes a long way to solve the problem of comfort for both riders, and very largely insulates the mechanism from vibration. Machines of this type will never be greatly boomed in the long-distance trials, because they are not speedy enough to make up time after a puncture, and therefore need

The Vindec Runabout, propelled by a 7-9 h.p. Peugeot twin-cylinder air-cooled engine through an epicyclic two-speed gear and V belt drive. With 2½ in. tyres, its total weight is stated to be 400 lbs.

an absolutely clean sheet if they are to emerge with credit from a six days' trial run on the legal limit principle. Herein they are eclipsed both by the motor bicycles and the powerful tricars, which can claim a perfect score even if they meet with a dozen stops of half an hour each, provided no two stops occur in the same control. But these little tricars are very cosy, very reliable, and very cheap to run, and their only two failings are that the passenger has to be dropped on exceptional hills of the Sunrising calibre, and that they cannot make up time and regain a 20 m.p.h. average after a half-hour repair stop. Hooydonk is one of the few men living who has repeatedly got a machine of this type through the long trials, and he does it by eliminating practically all stoppages and by lightning repairs or adjustments when the occasional stoppage overtakes him. One of *The Motor Cycle* staff is now running a tricar of this type, and is having great times with it, though a single puncture might destroy its chance of a gold medal if he were rash enough to enter it in the six days' trial next year.

STANLEY SHOW GLEANINGS.

EVERY year there are a few late arrivals at the show, and one finds some firm or other which, through stress of work or other causes, is unable to be ready on the opening day of the exhibition. Taking it as a whole, that part of the Stanley Show which is of interest to our readers was practically complete at the time of our visit on the opening day, but a further inspection of the stands revealed the following items:

A Twin-cylinder Lightweight Motosacoche. The engine has mechanically-operated inlet valves.

The Osborne Motor Mfg. Co. showed a new type of spring fork. The front wheel spindle is mounted in a pair of eccentric sheaves, which work in straps on ball bearings fitted to the fork and girder ends. The wheel spindle is placed considerably out of the centre of the sheaves, so as to allow it to travel round the requisite degree. To each of the sheaves are fixed pins at an angle of about 165° between lines drawn from the centre of the spindle to the centre of the sheaves. These pins are connected to a pair of side links which run upwards, and are connected to a pair of arms (forming one piece) swinging on the fork crown. These forks struck us as being well designed and devoid of all side play. An improved form of Osborne four-speed pulley, which obviates the necessity of using a jockey pulley, was also shown. This pulley works in the following manner: The back wheel is mounted in bearings working in specially constructed slides, which replace the ordinary fork

ends. The bearings are connected to the ends of two side links, which are connected at the other ends to a pair of arms, formed with a pedal carried in a specially constructed bracket. There is a ratchet on the left-hand fork end or slide which locks the wheel in the required position after it has been moved. To put it clearly, the back wheel is extended when the pulley groove is expanded, and *vice versa*. Both the

A $3\frac{1}{2}$ h.p. Osborne Motor Bicycle fitted with the same make of four-speed and free engine pulley. To do away with the necessity for a jockey pulley, the above machine has been fitted with a sliding back wheel to take up the slack of the belt.

pulley and rear wheel are operated by independent movements, but their manipulation is very quickly learnt.

S. Hall and Sons exhibited the F.R.S. lamps of all types. The latest of these is carried in a U bracket clipped round the handle-bar stem. This lamp, it will be remembered, has a hinged door back and front, so that the interior can be readily cleaned; a burner which can be moved nearer to or further from the reflector, so regulating the distance the beam of light is thrown; a couple of folding legs, so that the lamp can be stood in an upright position on the ground; and a ventilating cowl, which precludes all back glare. On the same stand the F.R.S. automatic generator and the F.R.S. front wheel stand were also shown.

The new pattern $3\frac{1}{2}$ h.p. Bradbury, with 87×87 mm. ball bearing engine. Other up-to-date features will be observed from the illustration.

A $3\frac{1}{2}$ h.p. Arno exhibited at the Stanley Show. The cylinder dimensions are 90×85 mm. The ribbed silencer is an iron casting.

Stanley Show Gleanings—

All motor cyclists will welcome the news that Kempshall tyres are to be made in all sizes for motor cycles, for they have gained such a big reputation for their excellent non-slipping qualities on cars. A. W. Wall, Ltd., were not slow to see what an attraction these tyres would be on their stand, and consequently fitted a number of them to their Roc motor cycles. If the Kempshall tyre proves to be as effective on motor cycles as it is on cars, and at the same time is as resilient as an ordinary tyre, it will very quickly spring into popularity.

The new Kempshall motor cycle tyre, which, it is said "never slips, always grips." It was shown on the Roc stand at the Stanley Show.

The Corah lightweight was one of the absentees from the Service Co.'s stand at the time of our first visit. This is a well designed and attractive machine, with 2½ h.p. J.A.P. engine, 70 × 76 mm., weighing complete 105 lbs. It has handle-bar control, B. and B. carburetter, and Ruthardt gear-driven magneto. The frame is low, the height of top tube being only 28 in. from the ground. The saddle is fitted on a horizontal tube which is telescoped into the end of the top tube. The spring front forks are the lightweight Druid girder pattern, and the handle-bars are nicely shaped to give the rider an easy comfortable position. The brakes are a pedal operated belt rim brake on rear wheel and a Bowden hand operated rim brake to front wheel. The wheels are 26 in. × 2 in., with standard Continental tyres, and wide, firmly attached mudguards are provided. The machine is sold complete with stamped steel stand built with the frame, carrier over rear wheel, and tool case. An illustration of the Corah lightweight is published on page 942.

A. Sparking plug adapter.
B. Spring prong connection.
C. Insulating fibre.

A neat sparking plug terminal on the stand of the City Ignition Co. is shown in the annexed line sketch. An adapter is supplied with each connection, which is tapped to fit the central wire of the plug. When the adapter is in position the prong of the connection is sprung on it, the prong fitting in the groove turned in the adapter. A fibre insulator is screwed on over the cable after the latter is attached to the connection. On the

same stand a novel expanding pulley gear was shown, known as the Mantell Leaver gear. In the case of similar change speed devices, the Osborne and Zenith firms avoid the use of a jockey pulley by extending the rear wheel of the machine to keep the belt at even tension when the pulley groove is expanded or contracted, but with the Mantell Leaver gear the engine

pulley is mounted eccentrically to the engine shaft, and a pinion on the engine shaft meshes with an internally toothed ring on the inner periphery of the pulley. As the pulley is expanded or contracted to alter the gear, the operating lever swings the whole device farther or nearer to the rear wheel without altering the tension of the belt.

Messrs. Brown Bros. showed a simple and effective form of electrical terminal made by Rouse Bros., which should be specially useful for motor cycle work. These terminals are made of heavy gauge copper, and have an open end with turned down lips, so that the terminal can be slipped into position without removing the nut altogether, and so the risk of losing the latter is reduced to a minimum. The turned down lips, moreover, prevent the terminal coming off if the nut should shake slightly loose. Milled screws can be reversed, so that the milled edge locks against the upturned lip.

A. Copper terminal.
B. Terminal hooks.

One of the many interesting Tee-Bee specialties is a spring clip for holding a high-tension wire. It is first attached to the tube underneath the tank, and in this position it is handy for holding the sparking plug wire when testing the ignition. Tee-Bee specialties were exhibited by Templeton Bros.

A. Band clip.
B. Lever for spring grip.
C. Spring grip for cable.

The change-speed gear box fitted to the four-cylinder F.N., which was shown on the stand of the F.N. Motor Agency, is placed between the bevel and the spur gear transmission, and surrounds the propeller-shaft. The gear box itself forms the right-hand chain stay of the frame, and replaces the ordinary round propeller casing. The box is divided vertically in the centre, the two halves being connected by bolts and

The Two-speed Gear shown fitted to a Four-cylinder F.N. at the Stanley Show.

- A. Top half of gear box.

- F. Sliding dog clutch.
- C3. Bevel pinion.
- H. Driven spur wheel.
- G1. Counter-shaft.

nuts. Power is conveyed from the engine-shaft to the spur wheel H in the usual manner. The wheel H is keyed to the shaft C, on which is a pinion D constantly in mesh with another pinion G on the counter-shaft G1.

Stanley Show Gleanings—

The pinion G_2 on the counter-shaft being always in mesh with pinion C_2 on the left-hand propeller-shaft C_1 . C_3 is the bevel driving pinion fitted to all four-cylinder F.N. motor bicycles. F is a sliding dog clutch on a square on shaft C , and dog teeth E_1 are formed on the faces of the pinions E and C_2 . When the clutch F is in the position shown in the sectional line drawing, the engine and the shaft C revolve without moving the road wheel. This is the free engine position. To engage the low speed, clutch F is moved to the right, and dog teeth on F and E being thus interlocked, pinion G and shaft G_1 and pinion G_2 revolve, also turning pinion C_2 and shaft C_1 , but at a slower speed than shaft C . The low speed ratio is about 10 to 1, giving ample power for all hills even when a sidecar is used. We understand that the fitting of this gear does not necessitate any structural alterations to the frame, and it can be fitted to any four-cylinder F.N. in a few hours.

A new pattern motor cycle frame (Sinclair's patent), suitable for a lady or a gentleman. It was described on page 921 last week.

A FOUR-WHEELED PASSENGER MOTOR CYCLE.

A PASSENGER motor cycle which attracted an unusual amount of attention at the Stanley Show was one exhibited by Messrs. Collier and Sons, Ltd. This was a twin-cylinder Matchless bicycle coupled to a two-wheeled Lowen sidecar, both specially built to the order of Mr. E. Körber, a Northern motor cyclist.

The combination is shown in the accompanying illustration. The engine is a 7 h.p. J.A.P., 76 × 95 mm., automatic inlet valves, Bosch magneto ignition, J.A.P. carburetter, handle-bar controlled, Dunlop tyres, 26in. × 3in. back and 26in. × 2½in. front wheels, 1⅞in. belt transmission, Nala gear giving ratios of 4 and 8 to 1, free engine, and new design Matchless spring forks. The whole bicycle and sidecar frame are enamelled French grey with green lines. The sidecar is 30in. wide inside, and the back 22in. high, coach-built, and finished dark green, and has two special luggage compartments and a Cape cart hood. Extra braking power is obtained by fitting a dummy belt rim on the right of the bicycle driving wheel, the usual foot brake acting on this. Before handing the machine over to Mr. Körber, Mr. C. R. Collier has promised to test it with passenger up a steep hill with a gradient not less severe than Birdlip.

Mr. Körber tells us that he has already planned a 1,600 miles zig-zag tour through Scotland with his

In describing the Service Company's exhibit we inadvertently omitted to mention the Advance Motor

The Chater Lea instantly detachable sidecar fittings, which will bring the rigid type of attachment more into prominence.

Company's extensible belt fastener, designed to work with adjustable pulleys, and a new lamp generator bracket forming part of the petrol tank clip.

This company was practically the first to place this last named handy device on the market.

A Twin-cylinder Wolf Bicycle with Ruthardt magneto, exhibited at the Stanley Show. Two legs attached to the crank case cradle, support the front wheel clear of the ground.

wife and child (five years), embracing all the most interesting places, next May and June. We hope to be able to record some of his experiences on the tour.

A 7 h.p. Matchless Bicycle and Lowen Sidecar exhibited on Messrs. Collier and Sons' stand at the Royal Agricultural Hall last week.

SPECIAL FEATURES

MOTOR BICYCLES AT THE
STANLEY.

RIDING POSITION.

TIME TO LIGHT LAMPS.—Dec. 2nd, 4.53 p.m. ; Dec. 5th, 4.51 p.m. ; Dec. 9th, 4.50 p.m.

Another Club for Birmingham.

We are informed by Mr. A. Manning-Lomax that another motor club is being formed in Birmingham. The majority of the members will be motor cyclists. It is for students of the Birmingham University.

Insufficient Warning.

Several motor cycle drivers summoned for exceeding the speed limit at Bromley complained that the notices were insufficiently prominent. There have been other complaints, and it is intended to improve the signs. The plain white discs have been taken for a tyre company's advertisement.

The Number of Motor Cycles in London.

During the third quarter of the present year the London County Council received application for the registration of 373 motor cycles, bringing the number of motor cycles registered in London to 9,211. No fewer than 4,102 changes of ownership were dealt with during the same period.

More Motor Cycles at the Stanley.

Elsewhere in these pages we publish a statistical table of the number of motor cycles which were on exhibition at the Stanley Show last week. This table has been prepared by Mr. Harry Hewitt Griffin, who is well known as a careful compiler of show statistics, and one whose figures may be relied upon as absolutely accurate. An examination of the grand total of motor cycle machines of all kinds reveals the fact that there were 207 complete motor cycles, excluding three carriers and one or two machines used for demonstration purposes. In addition, there were several detached sidecars which have not been included under any of the headings. The figures of the last two years show a decided increase, as in 1906 there were only 167.

Auto Cycle Union Notes.

The Auto Cycle Union annual dinner and presentation of prizes will be held on Saturday, January 30th, and will be preceded in the afternoon by a council meeting. The venue of the dinner and council meeting will be announced in a forthcoming issue.

The A.C.U. Formula.

In applying the formula $\frac{W}{C \times T}$ to

motor cycle engines of different types, the A.C.U. Competitions Committee consider that for two-stroke engines the capacity C should be multiplied by a factor 1.2. For a water-cooled engine the capacity C should be multiplied by a factor 1.1; thus for a water-cooled two-stroke engine the factor would be 1.32.

New A.C.U. Quarterly Trial Regulations.

During the luncheon stop no lubricating oil may be poured into the tanks, oilcans must not be used on the machines, and the belts may not be removed from the pulleys. All repairs to tyres will be counted as stops. In short, from start to finish no repairs or adjustments of any kind may be effected.

The Local Centre Scheme.

The A.C.U. General Committee has been discussing the scheme for the formation of local centres throughout the country, and it was finally decided to hold another meeting to discuss the matter on Monday next, the 7th inst. In the meantime, a copy of the draft rules have been forwarded to all members of the committee who are requested to read them carefully, and forward any suggestions to the secretary in time for the next meeting.

The L.M.C. Lightweight Twin-cylinder Engine.

The cylinders of this engine have no radiating fins, and it will be noticed that the motor is not central with the frame. the object

for this being that the cylinders are thus free to receive a good cooling draught. Though the inlet valves are situated in the crown of the cylinders, means are provided, in case of a leakage, to prevent the valves from falling on to the top of the piston.

Two New Magneto.

Particulars and illustrations of two new motor cycle magnetos are in the press, and will appear in these pages in next week's or the issue following. Their chief point is their small size and consequently light weight.

Business at the Stanley Show.

Good business was reported on all hands at the Show, and nearly all the motor cycles on exhibition were ticketed "Sold" by the middle of the week.

Last Week's Weather.

The weather last week could not be termed typical November weather, for it was quite mild, and on most days the sun made its appearance. Under these pleasant conditions, trial runs were given to intending purchasers by several of the exhibitors, who had trial machines outside the Hall.

Some Advantages of a Good Variable Gear.

We recently described and illustrated Powell's new two-speed hub gear, and for demonstration purposes Mr. A. D. Powell took his 80x80 mm. Fafnir engined bicycle with Millford sidecar down to the Royal Agricultural Hill. We tried the sidecar seat to see what could be done with the gear in thick traffic, and all readers who know the corners at The Angel, Islington, and King's Cross will agree that to thread in and out of the traffic at these points one must have a good two-speed gear. To thread a way through London traffic many sudden stops and starts are necessary, and there must be no hesitation about the engagement of the low gear when an opening presents itself. We were quite pleased with the ease with which Mr. Powell was able to manage the bicycle in traffic, simply by the aid of the low gear and clutch. There was no jerk or jar, and there was no necessity to engage the low gear as gently as one would expect with so small an engine, propelling two persons and a sidecar.

The Silver Cup in the Quarterly Trials.

Our readers will remember that the A.C.U. Competitions Committee offered at the beginning of the year a silver cup for the best aggregate performance in the three 1908 quarterly trials. The speeds accomplished on the two test hills (Dashwood and Gore Hills) were to be taken into account, as well as the rides accomplished without a stop. The trophy has been awarded to Mr. W. G. McMinnies, whose performances on a 3½ h.p. T.T. Triumph were by far the best. He qualified on each occasion of the 125 miles run for a non-stop certificate and twice made the fastest time on Amersham and Gore Hills.

Winter Week in Switzerland.

Those of our readers who have taken an interest in Mr. Douglas Fawcett's articles describing winter conditions in the Alps, will be interested to hear that the Touring Club de France is organising a great winter week in the district of Grenoble, Albertville, and Chamonix, between January 23rd and 30th, 1909. Full particulars can be obtained from the headquarters of the T.C.F., 65, Avenue de la Grande Armée, Paris.

Picking Up Speed Quickly.

Although out for his second motor cycle ride only, Charles Collins, of Smethwick, was fined £2 and costs at Acock's Green last week for travelling at an alleged speed of thirty miles per hour on the Birmingham - Coventry Road. Mr. Collins writes that he had been chatting with a friend at Yardley, during which time the engine of his machine had got cold. On restarting he ran twenty yards with his machine, jumped on, and had travelled only 100 yards or so when the police stopped him and accused him of riding at a speed of thirty miles per hour. If their accusation be true, we can only say Mr. Collins is the owner of a really good motor cycle of which he is no doubt proud.

A New Mudguard.

It is not often that one hears of improvements in mudguards, but the Maughan device sold by the Service Co., and shown on their stand, is a distinct novelty. It is well-known that the properly constructed front mudguard adequately protects the rider and the machine from dirt, but at the same time it keeps a draught of air off the cylinder. The Maughan mudguard, however, has a ventilating arrangement which, although it causes the air to impinge on the radiating fins, prevents mud and wet from reaching the rider.

The Stanley Show.

The line sketch of the Norton piston ring published on page 920 of last week's issue unfortunately depicted the ring as rather thick in section. The depth of the ring is correct, but on closer examination we find that the width of the ring does not exceed that of the ordinary type allowing for the depth of the special oil grooves.

Concentrating the Motor Cycle Exhibits.

Taking it as a whole, the Stanley Show was by no means disappointing as regards motor cycle exhibits, though

arrange this. For our part we can see no good reason why it should not be done.

A 'Varsity Competition Last Saturday.

That enthusiastic body, the Cambridge University Motor Cycle Club, held another competition on Saturday last, in the shape of a petrol consumption trial. The winners in the two classes—single and multi-cylinder—accomplished really excellent performances, Mr. N. H. Joy, successful in Class 1, riding at the rate of 167.79 miles to the gallon. Reckoning petrol at 1s. 2d. per gallon, this works out at twelve miles for a penny—something like cheap travelling. Mr. V. F. M. Oliver won the multi-cylinder class, his mileage per gallon being 109.47, notwithstanding that his mount was one of 5½ h.p. A word of credit is due to the officials, for the results of the contest were worked out the same afternoon, and forwarded to us by Mr. J. M. Oakey, the hon. press secretary.

The Paris Salon.

The eleventh exhibition of motor cars, motor cycles, cycles, and accessories was opened on Saturday last at 10 a.m. The Paris Show, as it is more commonly described on this side of the Channel, is held in a superb hall called the Grand Palais in the Champs Elysées, the West End of Paris. The floor of the hall is almost entirely devoted to motor car exhibits, the motor cycles being found in the galleries. A fully illustrated description of any machines or accessories of interest to motor cyclists will be published in our next issue. This will be written by members of the staff who have made a purpose journey to Paris to describe the exhibition. This year a great deal of the expensive, but beautiful illuminations have been discarded.

FUTURE EVENTS.

- Nov. 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.
- Dec. 12—Motor Cycling Club Annual Dinner.
- „ 10.—Essex M.C. Paper by Mr. H. G. Cove on "Motor Cycles, Accessories, etc."
- „ 16—Motor Union General Committee Meeting.
- Jan. 7—(Provisional) Essex M.C. Paper by Mr. H. M. Wyatt on "Magnetos."
- „ 16-23—Motor Cycle Show at Madison Square Garden, New York.
- „ 20—Auto Cycle Union Annual Dinner, preceded by the Council Meeting.
- „ 23—Essex M.C. Annual Dinner.

infinitely more might be done by the management to throw the motor cycle exhibits together. We should strongly advise the organisers to give greater attention to this important question. We heard many expressions of opinion on this subject last week, and several exhibitors of motor cycles said that they could not understand why the management could not so arrange the stands that the motor cycle exhibits were kept together. Our advice to motor cycle makers is to organise and approach the Stanley Show Committee as a body in time for next year's show, and request that steps be taken to

THE SIDECAR,

IN ITS RELATION TO THE BICYCLE AND THE TRICYCLE.

By DOUGLAS LEECHMAN.

IN adding an attachment like a sidecar or a forecar to a bicycle one necessarily converts the two-wheeler into a three-wheeler, and it is interesting to consider how far the machine loses its original character and acquires that of a tricycle by the alteration. In this article I propose to confine my attention to the sidecar part of the subject, and in doing so I shall generally use the term sidecar as indicating the complete machine composed of the bicycle and the attachment.

Strictly speaking, all sidecars are tricycles, as they exhibit the essential feature of three wheels, which the word tricycle (*tri* = three and *kuklos* = wheel) imports. And in this connection it is interesting to remember that in the past quite a number of tricycles have been constructed with two wheels at one side and one at the other, some of them being driven on one side only.

The Rudge rotary tricycle, with its single large driving wheel on one side and two small steerers on

the other, is a conspicuous example. The Grosvenor was another, and for a time it was the fashion to build the double driving front steering tricycles open fronted, the steering wheel (otherwise arranged central) being set in front of one of the driving wheels, and thus reducing the wheel tracks from three to two. Unless the wheels are all in line (like a curiosity exhibited at one of the cycle shows) or all abreast, a three-wheeled machine is properly described as a tricycle. One of the radical distinctions between a bicycle and a tricycle is that the former is supported by a base line, while the latter rests on a base area.

The base line support involves the necessity of balancing the bicycle to keep it upright, and the art is not easily acquired. I have only heard of two men who succeeded in riding a bicycle at the first attempt, but the almost invariable experience is that the beginner's natural inclination is to steer away from the side to which he feels himself falling, instead of

The Sidecar.—

steering towards it, and so bringing back the line of support under the centre of gravity of the machine and rider.

By "raking" or inclining the head of the bicycle the steering axis is brought in front of the point of contact between the front wheel and the ground. This gives a trailing action to the front wheel, which inclines it to run straight, and assists materially in the riding of the machine. If the weight is divided unevenly relatively to the central plane of the bicycle, it is necessary to lean the bicycle somewhat to one side in riding in order to keep the centre of gravity over the base line, but the lateral inclination of the machine causes the steering axis to meet the ground at a point to one side of the base line, which interferes with the trailing action and gives the steering a bias to one side. In rounding corners, however, it is quite right, and, indeed, necessary, for the rider to incline the machine sideways. If he did not do so the bicycle, instead of getting round the curve, would fly off at a tangent. The rider counteracts the centrifugal force, which tends to throw him outwards by a centripetal force created by leaning himself and his machine inwards towards the centre of the curve. The two forces thus balance the machine and rider on the base line, but if the road surface is slippery the inclination of the "body" may overcome the friction between it and the ground, and the lineal support will lose its characteristic and exchange it for an even more base support consisting of handles, pedal caps, knuckles, knees, and other points very ill-adapted to the purpose.

A Tricycle is Steered, Not Balanced.

The fact that the wheelbase of a tricycle has width as well as length requires that the machine, as ordinarily constructed, shall be steered otherwise than by balancing, notwithstanding that in the Crippler and De Dion types of tricycle the steering wheel, fork, head, and handle-bars are of the same design and construction as employed on bicycles. This being so, the natural inclination of the front wheel to trail in a straight path is preserved, but the actual steering is done as in a carriage, a traction engine, or a bath chair, *i.e.*, by setting the steering wheel at an angle to the others—without leaning the machine sideways. A novice can generally steer a tricycle without the least trouble, but the practised bicyclist often has to overcome the habit of steering by lateral inclination. True, a tricyclist leans in when going round corners to overcome the centrifugal force, but he leans relatively to the machine, not with it. It is ever so much easier for a bicyclist to learn to ride a tricycle than for a novice to learn to ride a bicycle. Tricycles having two wheels at the back very rarely side-slip, and when they do it is merely a matter of sliding sideways, not of upsetting.

Now the effect of connecting a sidecar to a bicycle all depends upon how the connection is made. If the connecting device is such as to still allow the bicycle to balance on its base line, the complete sidecar will retain the steering and other characteristics of the bicycle. The application of half the weight of the passenger attachment to one side of the bicycle will affect the steering to a certain extent, but this may be counteracted by adjusting the connections so that the side wheel is set at a particular angle. Where the

connection is made in such a way that the framework of the attachment is united with that of the bicycle to form a rigid whole, the bicycle is deprived of its unstable equilibrium in favour of stability of the tricycle, the complete machine then assuming the usual characteristics of the three-wheeler as to steering and otherwise.

The Sociable Sidecar.

But a rigid framed sidecar is not only a tricycle; it is a particular kind of tricycle, which early received the very suitable name of "the sociable." As a rule, the riders sat side by side between the two driving wheels, but, if I remember rightly, two sociables—the Rover and the Markham—were built with small driving wheels, and the riders sat one over each, but the disposition of the riders as on a sidecar is, I think, new. Mechanically, the steering to right or left of a tricycle may be considered as a motion about a vertical axis passing through the centre of gravity, or, more properly, the mass centre. When the load consisting of the rider is concentrated about that axis, as in the case of a single tricycle, the friction required between the front wheel and the ground, necessary in steering to overcome the moment of inertia acting about the mass centre, is comparatively small. But when there are two riders, as in a sociable or sidecar, the load is distributed at a considerable distance from the mass centre, and the moment of inertia, acting at a corresponding leverage, requires a much firmer grip of the steering wheel on the road, if the machine is to answer to the helm. This friction can be supplied by bringing the riders further forward, so as to increase the weight on the steering wheel.

A Tip for Rigid Sidecar Users.

Riders of sidecars that do not take corners well should considerably improve matters by leaning forward at such times, but with the weight properly distributed there should be no need for this. But where the rear wheels of the sidecar are coaxial the passenger seat must not be placed too far forward or the weight will come too near the oblique side of the triangular wheelbase, when leaning forward at a curve might cause an upset. If the seat is set forward, the wheelbase should be set forward also, by advancing the position of the side wheel, but this, when the axis of the wheel is fixed at right angles to the length of the machine, would only exaggerate the original difficulty of negotiating curves, as the "lead" of such a wheel, with its direction fixed parallel to the rear or driving wheel, would make turning towards the side wheel almost impossible.

We see, therefore, that the attachment of a sidecar to a bicycle produces a machine partaking very largely of the nature of a sociable tricycle, but that, if the connection is by means of freely moving joints, the bicycle action is retained in large measure.

On Tuesday last week A. W. Gamage, Ltd., Holborn, opened their Christmas bazaar, which eclipses all previous year's bazaars as regards novelty, interest, and magnificence. At the luncheon given to the press, at which Mr. A. W. Gamage presided, some copies of Gamage's sportsman's diaries were distributed. These diaries are thoroughly up-to-date, since the last in the list of motor cycle records is that of Collier's famous hour ride in October this year at Brooklands. Motor cyclists interested should write for details.

**Sheffield and Hallamshire M.C.C.**

The above club is holding the annual dinner and concert tomorrow (Thursday) at Hudson's Restaurant; dinner at 8 p.m. sharp.

A general meeting will be held at the club's headquarters Thursday, December 10th, at 8 p.m., to discuss the affiliation question. To be or not to be!

Essex M.C.

On the 29th ult. a very successful run to Witham took place, a large number of members turning out. The run next Sunday is to the George Hotel, Bishop Stortford. On Thursday, the 10th inst., Mr. H. G. Cove is giving a paper entitled "Motor Cycles and Accessories; Novelties and Criticisms at the Stanley Show." The paper will be given at the Great Eastern Hotel, Liverpool Street, and all motor cyclists are cordially invited. The annual dinner of the club has been definitely fixed for January 23rd.

Motor Cycling Club, Ltd.

The annual dinner of the M.C.C. will be held on Saturday, December 12th, at the Trocadero, London, at 6.30 p.m., when the prizes won in this year's competitions will be handed over to the successful riders. The *Motor Cycle* fifty one silver challenge cup was won outright by the Coventry Motor Club this year, and Mr. V. A. Holroyd (Coventry) has been invited to attend to receive the trophy. Tickets for the dinner can be obtained from Mr. A. Candler, Lime Grove, Shepherd's Bush, W.; price 7s. 6d.

Middlesbrough and District M.C.C.

The annual general meeting of the Middlesbrough and District Motor Cycling Club was held in the Grand Hotel, Middlesbrough, when Mr. Stanley L. Gjertsen (hon. sec.) read the annual report. The balance sheet, submitted by Mr. G. R. Sanderson (hon. treasurer), showed an expenditure of £69 8s. 5½d. There was an overdraft at the bank of £1 5s. 8d., as against a credit balance of £2 4s. last year. A party of members visited the Stanley Show last week.

Nottingham and District M.C.C.

The first whist drive of the above club took place at headquarters, the Welbeck Hotel, Nottingham, on Thursday last, November 26th, and, as is usual with this club's events, was very successful. Mr. J. Elliot Littlewood (chairman of committee) acted as M.C., ably assisted by Messrs. F. W. Preece, F. Mitchell, and R. S. Whaley as stewards. Mrs. Elliot Littlewood presented the prizes, the winners being Mrs. J. H. Scothern (first lady) and Mr. Dean (first gentleman), the consolation prize going to the hon. sec., Mr. C. Aubert Spring.

Cambridge University M.C.C.

The following are the results of a petrol consumption trial held by the above club on Saturday last, the 28th ult. The course, which was thirteen miles in length, had to be covered twice. The route was from Quy to Newmarket toll gates, from there to Six Mile Bottom, and back to Quy via Albraham:

SINGLE-CYLINDER MACHINES.

Name.	Machine.	Petrol used. Ounces.	Miles per gallon.
H. Joy (2½ Minerva)	...	24½	167.79

H. Stephenson (5 Vindec)	...	53	78.49

Walthamstow M.C.

The second annual dinner of this club will take place on Saturday next, the 5th inst., at the City Arms, St. Mary Axe, E.C. A good attendance is expected, as an excellent concert has been arranged by the committee, and an enjoyable evening can be counted on by visitors. Dinner will be served at 6.30. Tickets of the hon. secretary, J. W. Percival, 13, Church Hill, Walthamstow.

Impromptu runs will be made every Saturday during the winter months, at three o'clock, from headquarters (weather being favourable).

Barnsley and District M.C.C.

On the 13th ult. a meeting of motor cyclists was held at the Victoria Hotel, when a new club was formed, to be known as above. The club owes its birth to the members of the motor section of the Barnsley Victoria Cycling Club. For some time it has been felt desirable to run an entirely separate and distinct section, so the new venture was launched. The affairs of the motor section of the B.V.C.C. will accordingly be wound up in due course.

The headquarters are as before, viz., the Victoria Hotel, Barnsley. The members' yearly subscription has been fixed at 5s. The president is Mr. E. H. Longley, and treasurer Mr. C. B. Fallas. Prospective members are invited to communicate with the hon. secretary, Mr. F. Scolah, 49, Park Road, Barnsley.

Richmond and District M.C.C.

The annual dinner of the above club was held on Tuesday evening, November 24th, at the Trocadero Restaurant, the vice-president, Dr. W. M. Paul, in the chair.

After dinner, Dr. Paul presented the various cups and prizes to the winners of the contests during this year, and he said they very much regretted that their president, the Marquis de Mouzilly St. Mars, was unable to take the chair at this dinner, and he was sure the members would join with him in thanking him for presenting the magnificent cup to the club. He also expressed his thanks to the captain of the club for his kind presentation of another cup. He said he would like to say a few words with regard to urging the members of the club to consider the other users of the roads, and to drive with every care and consideration, and felt that it was the opinion of the members of the club that strong measures should be taken with any member who disregarded this wish of the club.

The captain of the club, Mr. A. Carpmael, jun., returned thanks, and said that he was pleased to hear that the club appreciated his action in giving a cup for competition, and he hoped that this would be an incentive to keep the members of the club together. During the course of his speech he made a strong appeal to the members to drive with extra care and consideration for the future, saying that there was no doubt a very strong feeling had arisen amongst some of the public against motors and motoring, and that, although he felt strongly this had been caused by the reckless and inconsiderate driving of a very small number of drivers, yet he thought that unless something was done very soon to alter this adverse feeling, there was great risk of very repressive measures being passed. The Captain then went on to point out how natural it was that people who live close to a main road, near large towns, who were not motorists, and perhaps had never been in a motor, should not love motors, and objected to having a continuous stream of fast traffic going past their doors, and he hoped members would try to remember this, in order that it might make them drive in such a way as to cause as little annoyance as possible to others.

THE NEW PENNY EDITION OF "THE AUTOCAR."

Readers of "The Motor Cycle" who are interested in motor cars are reminded of the new Penny Edition of "The Autocar," now obtainable of all Newsagents and Booksellers every Friday Morning.

Questions

and Replies

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E. C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Various Interesting Queries.

?

I have a $3\frac{1}{2}$ h.p. Triumph with Brown and Barlow carburetter, handle-bar control, and magneto ignition. (1.) What distance should the break between the platinum points be to get the best results? I can just get a worn sixpenny piece between. (2.) Are the Jebron iridium contacts as good as platinum, and will the two work together (iridium and platinum)? (3.) In running I get the best results with throttle half open, full air, and spark fully advanced. If I open throttle still more I don't get any better results. Does the engine get sufficient air, and if not how shall I increase the supply?—J.M.

(1.) Within limits the break is not important, but the makers recommend that it should be .5 mm. (2.) The contacts mentioned are quite good. Platinum and iridium would work together, but platinum being a softer metal it would be quickly flattened by iridium; better to have both contacts of same metal. (3.) It looks rather as if a bigger choke tube would remedy the matter. This can be obtained from the makers of the carburetter.

A Novice's Queries.

?

My cycle is a 4 h.p. two-cylinder N.S.U. (1.) How many hours non-stop ought I to ride without overheating, provided everything is in order (the gear is 4 to 1)? (2.) What are the signs of overheating? (3.) What is the damage done by overheating? (4.) Is a fan of much use? (5.) Is a deposit inside cylinders very bad?—R.A.

(1.) You should be able to ride the machine indefinitely if everything is in good order. (2-3.) The signs of overheating are strong smell, intense heat of the engine, excessive knocking, pre-ignition, that is to say, the engine continues to fire after the current is switched off. Possible damage done by overheating is seizing, unequal expansion, and decomposition of lubricating oil, while pre-ignition may result in a strained or broken connecting rod. We trust you are not under the impression that overheating must occur. Provided the engine is driven well within its power and is properly lubricated, overheating will not occur. (4.) A fan is of some use, but in your case a fan will not be necessary if the engine is running all right. (5.) Excessive deposit on the piston and cylinder heads tends to overheating and will cause pre-ignition. They should be scraped every 1,000 miles or so.

The Slipping of Belts.

?

I have quite taken a fancy to the O.T.A.V., but what bothers me is—(1.) How does it get round corners? The makers claim that there is no need for a differential on account of the belt slip. I cannot see it. I have used a 7-9 h.p. Peugeot motor bicycle with Phoenix forecarriage for two years, geared 4 to 1, with Whittle belt, and there is not the slightest sign of belt slip. Another thing, the belt they fit does not seem strong enough. (2.) Do you think 26in. by $2\frac{1}{4}$ in. Clinchers are strong enough? I fancy the car would be much better with $2\frac{1}{2}$ in. tyres. Please let me know what you think about this vehicle.—W.A.K., Derby.

Our experience of the voiturette enquired about is very limited, therefore we regret we cannot give you any very definite information. The makers will

Both wheels are in this manner driven at unequal speeds. Probably there is no slip at all on the driven wheels, i.e., the belt rims on back wheels, and all the slip takes place at the driving pulleys. (2.) $2\frac{1}{2}$ in. tyres would wear better and be more comfortable than $2\frac{1}{4}$ in.

Starting by Handle with Magneto.

?

I have just bought my first tri-car—a second-hand 9 h.p. Riley with twin-cylinder V engine. I am proposing to do away with the accumulator ignition and fit high tension magneto. Do you think that I should find any difficulty in starting with the magneto? Will the ordinary cycle size magneto do? If not, why not?—G.H.T.

You would find considerable difficulty in starting with a magneto unless the engine was fitted with a half compression release. It would be best to con-

A twin-cylinder fan-cooled N.S.U. Tri-car with front springing. The new N.S.U. epicyclic two-speed hub gear is embodied on this tri-car, and the ratios of gears are so arranged that an exceptionally large engine pulley can be used. It was exhibited at last week's show.

give trial runs to anyone interested, and our advice is to write them and ask them if they have a voiturette running in your district, or if they would send one for a trial run with a view to purchase. (1.) Although you cannot detect any slipping of the belt with your motor bicycle and forecarriage, there is a certain amount of slip taking place, particularly when engine is picking up speed. That is why a belt drive is more elastic than a chain. When the O.T.A.V. voiturette is turning a sharp corner the belt takes the place of a differential gear, because the belt on the inner wheel (which has to travel slower at the corner than the outer one) slips over the driving pulley.

sult the makers with regard to the half compression release and easy starting. The ordinary motor cycle size magneto ought to run the engine quite satisfactorily, but it probably would not start the engine as well as one made specially for motor car engines and with larger magnets. The reason is that with the motor cycle size the armature and magnets are so calculated as to produce a sufficiently hot spark for starting at a given speed, a speed which is very seldom reached when starting a car engine with a handle. It would probably be best to retain the accumulator ignition for starting, and then switch over to the magneto for general running.

Machine Stops on Hills.

[?] I have a 3½ h.p. 1907 Triumph which takes hills at a good speed, but which almost invariably pulls up near the top. On dismounting I find smoke issuing from the carburetter; after a few seconds rest the engine restarts, only to repeat the performance on the next hill. Have taken down engine, and found no deposit worth speaking of on piston or cylinder. Compression is also good. I should be glad if you could suggest a 6 h.p. two-seated car?—R.M.T.

he failure to climb hills may be due to your driving. Do you close the air over gradually as the speed of the machine falls off? If you do the trouble is due to poor compression owing to worn parts, or the gear is too high for your weight. The smoke issuing from the carburetter occurs in all instances when engine is hot and inlet valve happens to be raised, and the throttle open. It is from the hot oil in the engine. It would be best to have the engine overhauled, fit new exhaust valve spring, and lower the gear too high.

Cost of Running a Passenger Machine.

[?] (1.) I cannot make up my mind whether to go in for a new motor bicycle and second-hand sidecar or a small second-hand two-seated car, say 6 h.p. Leaving comfort out of the question it is purely a matter of which would be the cheapest to run that will decide me. I should be very glad to have your opinion as to which is cheaper to run. I may add that at present I know nothing about motors of any sort. (2.) The combined weight of self and passenger would be about eighteen stones, and I am told that in using a sidecar the back tyre of a bicycle wears out very quickly; in fact, one man tells me that I should probably require a new back tyre about every 700 miles. Is this so? (3.) If it is not so, how many miles do you think back tyre would run? (4.) Another man estimated cost of running bicycle and sidecar at about 2s. 6d. per 100 miles, including petrol, oil, and wear and tear. What would you estimate? (5.) Would you also be good enough to give me a rough idea of the cost of running per 100 miles a 6 h.p. two-seated car?—R.M.T.

(1.) By far the cheapest vehicle to run would be a first-class two-speed motor bicycle with sidecar. If you are about to begin motoring you should have a medium-powered motor bicycle of certainly not more than 3½ h.p. You should ride this for several weeks and then start with a passenger machine. (2.) Certainly there is more wear on the back tyre owing to the increased weight and strain. (3.) It is impossible to say how far the back tyre would last, but we should estimate a 2½ in. over at about 1,000 miles with passenger attachment. (4.) Your friend's estimate was about right. The cost of keeping up a 6 h.p. car would be quite three times this, and the licensing and registration would be £3 2s. for the car against £1 for the motor cycle.

Interested in Electrically Driven Tricycles.

[?] Would you please inform me if the electric tricycle illustrated in your issue of the 4th ult. can be seen in England—if not, the address in Germany? Further, could such an accumulator be charged at home by battery, and how long does it take to charge?—J.H.P.

We have received a number of enquiries similar to yours. The electric tricycle is sold in London by Mr. A. Straus-Collin, Bush Lane House, Cannon Street, E.C. The makers are the Berliner Elektromobil-Fabrik, Charlottenburg, Berlin. We have had no experience whatever with this vehicle, but we have been promised a trial run as soon as a sample of it reaches here from Germany. The accumulators are very much larger than those used for ignition purposes, and would take a considerable time to charge even from a dynamo.

Tuning Up for Hill-climbing.

[?] My machine with 85 by 85 mm. engine fails up any gradient steeper than 1 in 12, and even then only gets up by rushing. Compression is very good, gear 4½ to 1, Longuemare E carburetter 6-jet, magneto. In spite of the small jet, starting is very easy, and I can give all extra air when started. Level of petrol correct. Valves and magneto are timed right, and all levers set correctly. Valves lift sufficiently, that is about 2 mm. In fact, it is a problem which has proved too difficult for me to solve. On the level and down hill machine is fairly fast, but not as good as it might be.—M.F.J.

Which valves do you refer to when you say they lift sufficiently, i.e., about 2 mm.? 2 mm. is nothing like enough for the exhaust valve, which should lift about ¼ in.—approximately 6 mm. The inlet valve, if automatically operated,

should open about ¼ in. If you are correct in stating that the lift of the valves is but 2 mm., the cams must be worn badly, or the clearance between valve and tappet is more than 1-32 in. Increasing the openings of the valves will make a wonderful difference. Also try a slightly larger jet and air adapter. This should give more power in hill-climbing.

Taking a Motor Bicycle to the Tropics.

[?] I am taking a motor bicycle to the tropics—Straits Settlements. It is a 3 h.p. Quadrant, surface carburetter. (1.) Are there any special tyres recommended for the tropics? I have an idea that Dunlops make a special one. (2.) Would a Whittle belt be all right, or is rubber better? (3.) Are any precautions necessary with regard to the treatment of accumulators while out there? Any other information which you think would be of use would be very acceptable.—R.W.H.N.

(1.) The Dunlop Tyre Co. make a tropical cycle tyre, and we believe also a tropical motor cycle tyre. We should advise you to write them and other tyre makers to become enlightened on this point. (2.) The leather belt mentioned would, we think, suit your purpose excellently. (3.) The safest precaution would be to use a magneto, not that accumulators would give more trouble abroad than in England, but you might have difficulty in getting them charged. If you can get a magneto fitted to your machine we think you would find it would be well worth the expense entailed.

Cooling the Engine Down Hill.

[?] When coasting down hill what is the best way to cool the engine? I always, when circumstances allow, switch off, give it full throttle, and do not raise the exhaust. I am told I am wrong, and that it would cool better by cutting off the gas and raising the exhaust, but in that case I imagine it would only draw comparatively hot air through the silencer. My informant further said that cold air was more cooling than mixture through the throttle. Is any motor cycle fitted with a device which would make such an operation possible?—F.B.

Your informant is incorrect, because it is impossible to draw cold air into the engine by closing the throttle and lifting exhaust valve. As you say, only hot air is drawn in through the silencer. Opening the throttle and air levers and merely switching off the ignition must cool the engine much more effectively, as the temperature of the gases is very much lower even than the air that would be drawn in, provided there was a sufficiently large opening in the inlet pipe independent of the throttle. Another good way would be to put a slide in the inlet pipe between the throttle and engine, so that cold air only will be drawn in when coasting. This would be more economical than drawing unconsumed gas through the engine.

Books for . . . Motor Cyclists

Motor Cycles & How to Manage Them.

Price 1/2, post free. 12th edition.

Entirely rewritten and brought right up to date. Useful alike to expert and novice. The whole of the information given is applicable to any of the leading makes of motor cycles on the market.

Hints & Tips for Motor Cyclists.

Price 1/2, post free.

Reprinted from *The Motor Cycle*, and now issued in book form for the first time. Contains information of much value to all motor cyclists.

"The Autocar" Folding Map of England and Wales.

Price 8/10, post free.

A real necessity when on tour. It is well printed on linen, and folds up into a neat and strong case, 7½×9½ in. An indispensable motor cyclist's companion.

A full list sent on receipt of postcard.

ILIFFE & SONS LTD.,
20, TUDOR ST., LONDON, E.C.

A Light and Inexpensive Tricar.

AUTO-CARRIERS, Ltd., 158, Norwood Road, West Norwood, S.E., who are fully alive to the possibilities of the light and inexpensive tricar, have introduced a vehicle of this type which promises to be a distinct success. One of the great advantages which it possesses is that the front seat can be very easily detached, and, as our illustrations show, a carrier box can be put in its place. The engine is a 5-6 h.p. (90 × 102 mm.), the valves are fitted fore and aft, and the inlet valve is mechanically operated. There are two large flywheels A A with heavy peripheries, and these flywheels allow the engine to run extremely slowly. They drive two fans B B, one on each side of the combustion chamber, by friction wheels which bear on the peripheries of the flywheels. The forward end of the crank chamber forms an oil reservoir, and it is only necessary to fill this at the beginning of the day's run. A small push button C at the end of this chamber is intended to be depressed by the heel when it is required to give the engine an extra supply of oil. The carburetter D is of the automatic type, and as the float is annular it is very compact and takes up very little room. The two control levers E E, throttle and spark advance, are situated on the side of the vehicle, as shown in the illustration referred to above. The frame is a distinct departure from standard practice in the construction of tricars. It consists of ash members reinforced by side panels of birchwood, while the engine is carried in a small cubical frame supported in clips from the ash side members. The springs L are bolted on to the end of the frame, and the general springing arrangement follows the lines of the Lanchester and Oldsmobile cars.

Accessibility of the Engine and Parts.

The accompanying illustrations show the accessibility of the vehicle. The back seat is easily removed, and exposes the engine and carburetter, while the removal

of the epicyclic type. A large band brake M controls the low speed, and an internal expanding clutch the high speed, both being operated by a horizontal lever N shown. The steering is by means of a tiller K, which has to be lifted vertically to allow the driver to take his seat. On the road the engine runs very

Rear view of the A.C. Tricar, showing the air-cooled engine, transmission, and hub gear.

sweetly, picks up quickly, and is capable of propelling the machine at a good speed. Being wide the tricar takes the corners very well indeed, and is no mean hill-climber. Fitted with a $3\frac{1}{2}$ to 1 top and a 7 to 1 low gear, the tricar is sold subject to its climbing Jasper Hill, near the Crystal Palace, with two people up. This hill has a gradient of 1 in 5. Tyres of ample size are supplied, so that purchasers should have no trouble in this respect.

To put it briefly, the Auto-carrier tricar impressed

The Auto-Carrier tiller-steered Tricar, with air-cooled engine.

of the heel board renders everything still more easy to get at. The contact breaker H is shown outside the body and at the base of the steering column. Accumulator ignition is fitted, but magneto can be had if desired. The transmission is by means of a single chain from engine to back wheel, and the two-speed gear is

The A.C. Tricar for business purposes.

us most favourably, and reflects great credit on its designer, Mr. John Weller, who has had considerable experience in designing various types of motor vehicles, and who, as early as 1903, designed and built a motor bicycle.

LETTERS TO THE EDITOR

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The Editor does not hold himself responsible for the opinions of his correspondents.

Simplifying Starting by Handle.

[3692.]—In your issue of November 11th "Essex" asks for a suggestion for fitting an exhaust valve lifter near the saddle, in order to facilitate starting by handle on a machine fitted with a Roc clutch. Perhaps the following suggestion will be of some use to your correspondent. Braze or clamp a piece of lin. tubing to the saddle pin and fit to this tubing a Bowden valve lifter lever similar to the one fitted to the handle-bar. Both wires can work the same valve lifter as fitted to the engine. Operating one lever will probably cause the other to move, but this will not matter. There would be no difficulty in fitting tubing and lever in a convenient place behind or under the saddle, and if strong tubing were used it would serve as a very good place to hold the machine up by whilst turning the handle.

CYRIL ROSE.

Multiple Jet Carburetters.

[3693.]—You published recently a very interesting and lucid article by "Ixion" on the ideal carburetter. I wonder if he has considered the advantages of having more than one induction chamber and jet. We all know that for hill-climbs a larger jet is generally fitted, since the "best all round" jet does not give the maximum of power. Would it not make the average touring machine better if it had a two-jet carburetter, one jet adjusted for getting this maximum power? The other jet might be made very much smaller, as it would only have to provide gas for running on the level and in traffic. In other words, we would be able to make our machines at once better hill-climbers and quieter in traffic. The average motor cyclist, especially if he rides a single-cylinder machine, will give anything for a few more m.p.h. up his favourite test hill, whilst the great B.P. would look with more favour on motor cycles if they were quieter.

At the same time, if one could adjust the main air inlet to the induction chamber for the small jet, very slow riding in traffic would be easier and less anxious, since one would not be so frightened of the engine stopping. Carburetters, too, that allow of admitting fresh air to the cylinder, when the throttle is closed, will no doubt be more popular in the near future.

I do not think that this double jet idea need necessitate any complication or delicate mechanism. Such a carburetter as the B. and B. with barrel throttle and extra air inlet from the side might be quite easily adapted. Of course, we can now get handle-bar control with this type.

I have thought for some time that this two-jet idea is one which would lead to considerable advance in motor cycle design, and note with pleasure that it is now being taken up on quite a number of cars. But what does "Ixion" think?

H.M.

A Suggested Conference of Motor Cyclists.

[3694.]—The thought has occurred to me lately that the officials of motor cycle clubs have not sufficient opportunities for thoroughly discussing the various important items that form the programmes of our various clubs during the year.

With that idea, I beg to suggest to your readers, especially those connected with motor cycling organisations, the holding of an annual conference of motor cyclists when the secretaries and other club officials could meet and talk over their programmes for the coming year.

I know many of your readers will agree with me when I say that there are many things in club life that could be greatly improved, and I am certain that such a conference would do a great deal of good if the officials of the older motor cycle clubs could be induced to give their ideas of

running a club. They could also give many a wrinkle on the running of a successful competition, they having, I am sure, bought their experience, and their advice would be of untold benefit to the rapidly increasing number of new clubs which are springing up all over the country.

The idea of a meeting on these lines being held during the winter especially commends itself to me, owing to the fact that the A.C.U. is about to inaugurate the centre scheme during next year, and if this conference was held, I am sure that those gentlemen who are so keenly interested in the union of motor cyclists, such, say, as Mr. F. Straight, Mr. Rees Jeffreys, and Mr. J. H. Hall, would be only too glad of an opportunity to place their views before a representative gathering of motor cyclists affiliated and unaffiliated.

Should the idea of a meeting on the lines I have indicated commend itself to your readers, I shall have the greatest pleasure in doing what little I can to bring about a successful gathering, and to that end I should like to suggest that steps be taken to hold a conference in a city where good railway and hotel facilities are available, say Leeds or Manchester, during either January or February, the meeting to extend over two or three days.

T. H. STRAKER,

Hon. sec. Hull and East Riding A.C.C.

Acetylene Gas Generators.

[3695.]—Replying to "J. F. L.'s" letter [3641], I do not agree with him when he says that water can be kept for any time in the Autoclipse generators after the light is extinguished. I have tried it myself, and find that the carbide decomposes, no matter what one does. My idea for improving the Autoclipse generator is as per sketch. When water is turned on it makes the generator automatic in the usual way. The water could then be carried in the generator without any likelihood of carbide being wasted. This is what I intend to have done with my generator. May I also mention that I think the majority of burners fitted to motor cycle lamps are very much too small. I have changed mine in the two lamps which I always carry, one to a 14 litre burner and the other to a 21 litre burner, and find that I have now plenty of light, and the beam of light shows me the road about 100 yards ahead, which before I changed the burner it would not do. Being an all-weather rider I quite agree with "Ixion," and not with Mr. Hart-Davies, about wearing of gauntlets and rain getting inside. I always wear my sleeves tucked inside my gauntlets, and have never found the rain trouble me, as I ride with my elbows lower than my hands. Having tried both ways I can speak from experience, and consider it dangerous to ride with sleeves outside gauntlets, as I found that the sleeves caught in handle-bar and brake lever, which once or twice nearly gave me a bad fall.

D.H.O.F.

- A A. A brass cylinder soldered to top of diving bell
- B. A needle valve.
- C. A pipe to allow water to flow down to bottom of bell.

Road Dangers at Night.

[3696.]—I was very pleased to see that someone had taken up that most serious of all points in our traffic regulations, night road dangers, and hope it will be kept up and something done. The other day a man in the Eastern Counties was summoned for driving a vehicle (to wit, a donkey and cart) without a light. The night was a bright moon-lit one, his lamp had just burnt out, and he being a poor man, and having more candles at home and not much cash on him, refrained from buying one; besides, it was a by-road with

little traffic. He was fined. A few days ago—one very dark night—I was on the Norwich road and narrowly missed running into the back of a hay waggon (a slow moving vehicle); it had one lamp on the front, stuck up in the centre of the load, so not a glimpse of it could be seen from behind. A little further on I ran into a drove of bullocks and was thrown off. On my return journey I was passed by a motor car (a fast moving vehicle), which carried a rear light visible for 200 yards. This is my point: As the police and bench convicted a poor man like the owner of the donkey-cart in question, is it not feasible that a contractor or farmer could afford a penny and a 1s. 6d. lamp out of the cartage of many loads of hay to carry a rear light? Also, if a farmer can afford to buy forty head of stock and send two men home with them, surely he could afford a 1s. 6d. or 1s. lamp, or even two, and compel each man to carry one. A motor car is compelled to carry a rear light, and it is a fast moving vehicle not likely to be run into from behind. Can anyone explain the consistency of our byelaws? I am no correspondent and hate writing letters, but if I thought writing would do any good I would gladly give up the next six months' spare time to it, and I hope my fellow readers of *The Motor Cycle* will not let the matter drop.

I recently encountered another danger when riding on a straight length of road just after lighting-up time. Suddenly, without any warning, two horses wandered on to the road at right angles from a farm gate, and I only just missed them. I stopped for explanations, and found that it was usual for the horses to go to water, and return themselves alone, every night, summer and winter, about six o'clock, the horse pond being situated a hundred yards down the road.

AH 441.

Carburettors on Twin Engines.

[3697.]—The average carburetter on a twin is not capable of giving nearly enough air. On my own machine, a 5-6 h.p. Peugeot, Longuemare carburetter, 7 spray, 22 choke tube, all the extra air I could give it was through two slots half an inch long by a sixteenth wide; with this open it was not the slightest use opening the throttle more than two notches, as it gave such a rich mixture that the engine quickly overheated with throttle further open. I have now cut a slot in the side of the spraying chamber (3in. by 7-16in.) controlled by a revolving shutter, and several 5-32in. holes in the inner barrel which holds down the choke tube, so that now it can get enough air. I hope next year we shall see larger extra air ports. and the main air intake made adjustable.

AS 46.

Advantages of Belt Transmission.

[3698.]—In answer to letter 3665 concerning the relative advantages of belt over bevel gear transmission, it is not altogether surprising that "M. D." finds no shock, excessive tyre wear, etc., with his four-cylinder F.N., and in case other readers may require some explanation of the reason I should like to ask "M. D." to think for a moment. It would be practically, if not mechanically, impossible for a single-cylinder machine to have such a positive drive. With the four-cylinder F.N. there is an almost continuous pressure forcing the back wheel round, due, of course, to the four cylinders and two impulses for each revolution of the engine-shaft, whereas for two revolutions of a single-cylinder engine one only gets one impulse. Just imagine the jerk one would get in starting up with no give on the driving mechanism. Again, when climbing a hill, if by any chance one had to slow up when near the top or on a severe brow, when restarting, the teeth of the bevel wheel would certainly shear off. No doubt the present-day singles have a wonderful degree of flexibility, but if gear transmission had been practicable I think there is no doubt it would have long ago been adopted.

E. LEIGHTON.

Tandem Motor Bicycles.

[3699.]—Whilst your correspondent Mr. B. H. Davies has a wide experience of motor cycles, I think he can have had little or no experience with tandem motor bicycles. He practically admits so. This type of machine is very nearly extinct, for obvious reasons.

As regards cost, economy, reliability, speed, and hill-climbing this type cannot compare with a standard single with

rear tandem passenger attachment, such as is marketed by Chater Lea, and was shown on a Bradbury at the Stanley years ago.

As the pioneer rider of this type I have naturally been interested to notice its increasing popularity. As a sporting and touring machine no other form of passenger attachment can touch it. Years ago the writer carried out a successful tour with a passenger in this way, the machine being a 2 h.p. Minerva.

For speed, economy, and hill-climbing, a first-class 3½ h.p. machine suitably geared will carry a rider and passenger at increased speed on the level and up hills better than a machine of double and more power with a sidecar. It simply calls for a stronger back tyre and more care on greasy roads and at corners. Whatever advantage there would be in a tandem proper I for one entirely fail to see. Apart from the cost, such a machine is entirely unsuitable for driving solus; then there is the matter of storage and intricate steering.

I was once acquainted with such a machine, the engine of which was controlled by the rear rider. The front rider had to steer and shout out instructions. The machine had a very short but eventful career.

Next, perhaps, someone will make the brilliant discovery that what the motor cycling world awaits is a tandem bicycle designed for a lady to steer, and perhaps some misguided maker would even introduce such a machine. C.M.F.

The Fitting of Spring Footboards.

[3700.]—I noticed a query in *The Motor Cycle*, signed "J. G.," regarding fitting footboards to a 1908 Triumph. I may say I have had a pair, both on this and last year's Triumph machine, of my own design, which were made by a local engineer, and have proved perfectly satisfactory. They consist of two birch boards 17in. long by 4½in. broad by ½in. thick, covered with rubber matting and edged with brass beading. These are clipped round the existing footrests, which have been bored out slightly to admit of a tube, just long enough to tighten up the nut of spindle, so that the rubber rests are free to revolve without the spindle turning; this is for the leading ends. The trailing ends are supported on angle brackets carried on a spindle passing through the bottom bracket in place of the crank axle. The ends of the boards are sprung by means of a spiral spring of lin. diameter, threaded over a pin passing through the axle brackets and secured to the boards by a plate.

The whole arrangement is simple to make, looks well, and can readily be replaced by the pedalling gear if desired.

I have found it most comfortable in riding, and so far, due to the reliability of the machine, have not felt the loss of the pedals.

R. G. HONNINGTON.

Magneto Manufacture.

[3701.]—Having read the letter from the Bosch Magneto Co. on the above subject, we feel that it is necessary for our company to reply to it, both as magneto manufacturers and also as members of the British electrical engineering trade, which the Bosch Co. criticises and condemns in no uncertain manner. It does not follow that, because the difficulties in the way of producing a British magneto are great, they cannot be overcome, and therefore some credit is surely due to us for producing a magneto which can stand on its merits against any other magneto.

Taking the points raised in rotation:

1. If there is a limited demand for magnetos, surely that is no reason why nobody else should make them but the Bosch Co.

2. Time will prove whether the Bosch Co. is in a position to supply the demand. Many companies would like to be in the ideal position of supplying the whole market with their goods without any competition. The Premier Accumulator Co. is also in a position to fill the demand for magnetos for motor cycles, but we have not the presumption to suggest that no other firm should make them because we can supply all that are wanted.

3. Even if the Bosch Co. does buy its materials from all parts of the world, we see no reason why a machine built in England cannot be as good as one built in a foreign country. Our company, however, makes a point of buying all its materials in England, as we have yet to learn that stuff bought abroad for magnetos is better than that bought in this country from British traders.

4. No firm with any respect for its future would expect customers to experiment with goods supplied it. All the experimenting necessary is done at our works before the machines are placed on the market, and during the last two years we have had no complaints respecting our magnetos.

5. We cannot understand your correspondent talking about lack of enterprise in the British, for was it not an Englishman who until recently was the life of and partner in the Bosch Co., and who did much to place it in its present high position? But if years of experimenting, to reach the high favour at present held by the Premier magneto, show lack of enterprise, then we must plead guilty to that delinquency.

With regard to the upkeep of sentiment, the Premier Accumulator Co. is quite satisfied with the results obtained by its magnetos, and is fully prepared to let them stand on their merits against any other make on the market, knowing that they will hold their own without regard to sentiment.

The comparative cost of British and foreign-manufactured goods to the British consumer raises a very nice point, for we all know the disadvantages which a British manufacturer works under when competing with the foreigner. This is the real reason of the preponderance of foreign magnetos in this country.

As regards the last paragraph in the Bosch Co.'s letter, we are astonished that anyone in a responsible position connected with the electrical engineering trade should make such a statement. We are sorry for your correspondent's experience; he has yet a great deal to learn. We can name plenty of firms in England who can produce electrical apparatus far more delicate and accurate than any magneto.

To advance such arguments is ridiculous, but the reason for them may be that, now that some opposition has arisen, British magneto manufacturers are looked upon as trespassers in their own land.

The Premier Accumulator Co. is so satisfied with the superiority of Premier magnetos that it is quite willing to submit them for test, on any well-known make of motor cycle for any length of time, against any other make.

In conclusion, we believe the time is not far distant when manufacturers of the best motor cycles will insist on having magnetos of British manufacture on their machines, as, although British engineers may be conservative in adopting new things, when once they have manufactured the goods it is usually found that the British-built article is in no way inferior to its foreign rival.

With respect to special machinery, this, of course, is needed in every trade. No one would lay down a plant for manufacturing traction engines if he intended to make magnetos. The Premier Accumulator Co. has laid out its works with all the special plant required to turn out a magneto of British manufacture, and intends to show that "the standard of work at present being carried out in our largest electrical works," as stated by your correspondent, is not "far too inferior to meet the requirements of magneto manufacture."

We claim to have produced a magneto far more simple and far superior in design and workmanship to any foreign magneto. THE PREMIER ACCUMULATOR CO., LTD.

[3702.]—With reference to "Britisher's" letter [3684] regarding magneto manufacture, we should like to point out that this gentleman's conception of the difficulties surrounding the manufacture of magnetos is seriously lacking, as the fact that a man can manufacture an accumulator and coil is no criterion whatever as to whether he can manufacture magnetos, any more than it follows that if a man can make an accumulator he can build a motor car. Both are totally different from one another. For instance, the designing of an accumulator is purely and simply the work of a chemist, while the designing of a magneto is the work of electrical and mechanical engineers, and, while we do not state that there is no such being capable of carrying out the combined work, we do say that up to the present nothing startling has resulted from the combination of the two industries above referred to.

With regard to coil construction, we quite admit that this is a simple matter in the hands of the expert, but we would also mention that one of the chief reasons why the induction coil has so readily given way to the magneto is because it is, on the face of it, a simple article to manufacture, and the manufacture of it has been taken up in many cases by men who are only able to copy other people's work, and not able to design their own apparatus or able to work out their own formulae. In consequence of this many thousands of extremely unreliable ignition coils have from time to time been put on the market at ridiculously low prices. In doing this the manufacturers have only assisted the pioneers of the magneto industry to bring their appliances to the front.

For THE BOSCH MAGNETO CO., LTD.,

ARTHUR E. BENNETT.

The Future of the Tricar.

[3703.]—I herewith enclose a photograph of my light tricar. It has $4\frac{1}{2}$ h.p. Stevens engine, Phoenix forecarriage, Chater-Lea frame, footboards to back wheel, 26in. by 2 $\frac{1}{2}$ in. tyres to all wheels, Rich tube in back wheel, 1in. Whittle belt. The front seat is well sprung, and saddle (Brooks's

B100) is all right up to legal limit. I run belt slightly loose, and do not feel kick of engine. All I want to make this machine perfect is a good two-speed gear and free engine. E. MARSH.

EXPERIENCES WANTED.

"W. A. M." would be glad to learn if any readers have converted a two engine Quadrant tricar into a one engine twin-cylinder machine; if so what structural alterations were made, and what form of two-speed gear employed?

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

Watawata

LONDON:
W. B. BROOKE
 318, King Street,
 HAMMERSMITH.

THE BELT WITH A BULLDOG GRIP.

The Watawata never slips or slackens, but, if rightly cared for, holds with an iron grip. extracting from your machine every ounce of driving power it is capable of. It is constructed in a most ingenious manner of carefully selected material and serves its purpose longer and better than any other belt can possibly do.

 ROCHDALE.

BRADBURY

3½ h.p. MOTOR CYCLE

will be their Standard Pattern for the ensuing season. Whilst retaining the special features in engine and frame construction for which it has been celebrated for five years, it will also have several detailed improvements. Ball bearings to mainshaft, improved silencer and tank, Bosch magneto ignition, low built frame with long wheelbase, and spring fork attachment.

Price £46.

BRADBURY & CO. LTD. wish to remind you that the motor is made at their works; that it has several special features and advantages over any other type; that all parts are standardized, and when replacements are required they can be obtained promptly and at reasonable prices. Foreign makers cannot offer you as good a machine or the same advantages.

THE BRADBURY HAS BEEN AWARDED 17 GOLD MEDALS IN RELIABILITY TRIALS.

BRADBURY & CO. LTD., WELLINGTON WORKS, **OLDHAM**

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or sent to London (20, Tudor Street, E.C.), the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.
York and Lancashire.

SECTION III.
Derby, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.
Suffolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.
Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.
Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.
Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.
Dorset, Devon, Dorset, and Cornwall.

SECTION X.
Ireland.

SECTION XI.
Isle of Man.

ORDER NOW

and avoid vain regrets. IF YOU DESIRE EARLY DELIVERY OF YOUR
1909 TRIUMPH, 1909 PREMIER, 1909 REX, 1909 N.S.U.
or any other **FIRST GRADE MOTOR CYCLE, YOUR ORDER SHOULD BE PLACED NOW WITH THE PREMIER MOTOR CYCLE AGENCY, or you will have to wait long for your turn. A liberal allowance on your old machine.**

SHOP-SOILED and SECOND-HAND SINGLE CYLINDERS.

TRIUMPH, 1908 (October,) with costly extras and spares, as new	£47 10
TRIUMPH, 1908, Palmer back tyre and other extras accessories, perfect	£35 0
TRIUMPH, 1908, very good order	£32 0

WRITE FOR LISTS OF ACCESSORIES.
PREMIER MOTOR CO., LTD.

Aston Road, BIRMINGHAM.
Telephone 4,310. Telegrams: "Primus, B'ham."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Little and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

N.S.U., 5½ h.p., fast machine, splendid climber, condition guaranteed as new, 2½ tyres and belt, both new, numerous spares, including new cover; bargain at £25. —No. 1,168, The Motor Cycle Offices, Coventry.

6 h.p. N.S.U., guaranteed perfect, enamelled white, two-speed, magneto, Palmer cord on back, splendid hill-climber, also Millford castor wheel sidecar; £50, or separate; machine was delivered in February. — No. 1,296, The Motor Cycle Offices, Coventry.

ENGINEER, on being presented with car, would sell his 7-8 h.p. 1908 Minerva, special Simms-Bosch magneto, spring forks, free engine clutch, a. 1 hub starting, lamp, horn, and all tools, ready for the road, and not done 500 miles; cost £66, take £43; experts invited.—Pike, 6, Beech Grove Road, Newcastle-on-Tyne.

SECTION II.

York and Lancashire.

23 h.p. Minerva, M.O.V.; sacrifice £8 10s.—Ince, 392, Halliwell, Bolton.

BAT, 4½ h.p., spring frame, new tyres, starting handle, perfect: £16. — Dudley, Wadsley Bridge.

STOCKPORT.—1908 Triumph, handle-bar control, magneto, only run 1,200 miles; bargain, 34 guineas.

STOCKPORT.—1907 Triumph, magneto, in splendid running order, beautiful machine; 24 guineas.

STOCKPORT.—If you want a cheap, second-hand Triumph, don't miss our stock.

STOCKPORT.—A 3 h.p. magneto Fafnir, three speed; for £15; what next? Perfect condition.

STOCKPORT. — Sole northern concessionaires for the new Corah lightweight, the British built practical lightweight; ample power, minimum weight.

STOCKPORT.—Now is the time to place your order for the new model Midget Bicar for prompt delivery; many detail improvements. The wet weather machine. —Sole northern concessionaires, Lund and Sergeant, Prince's Street, Stockport.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

MOTOR BICYCLES FOR SALE.

3 h.p. Brown, just overhauled; no reasonable offer refused.—175, Valleria Road, Acton Vale, W.

N.S.U., 3½ h.p., magneto, guaranteed perfect; £18, or what offers?—H., 1, Church Road, Hampstead.

3 h.p. Genuine Werner, 26 wheels, low build, and fast; £9 10s., or nearest.—478, High Road, Tottenham.

1907 Twin Rex, splendid condition, very reliable; £17 cash.—Rotom, 9, Cannon Place, Hampstead.

3½ h.p. Rex, engine overhauled, new back tyre; bargain, £6 10s.—Hampson, 15, West Street, Pimlico.

4½ h.p. Excelsior, Coventry, excellent condition; great bargain. — Austin, Friars Lane, Richmond.

3½ h.p. Rex, new condition, all accessories, splendid bargain; £14.—64, Bassett Road, Notting Hill, W.

KERRY, 2½ h.p., easy starting, splendid engine; cheap, £11.—Apply, A. E. Davin, 122, Warwick Street, S.W.

6 h.p. Twin Bat, Jap engine, spring back and front; £25.—At Wauchope's, 9, Shoe Lane, Fleet Street, London.

2½ h.p. Vindec, magneto, reliable machine, good condition, accessories; £13.—9, Mortimer Road, Kensal Rise.

F.N., 2½ h.p., Chater-Lea, new tyres, low, perfect.—Letters, Sparrow, 59, Camberwell Grove. Quick sale, £10 10s.

MINERVA, 3½ h.p., M.O.V., footboards; sacrifice £8 10s., no offer.—Confectioner, 12, Kew Bridge Road, Brentford.

£10.—3½ h.p. Centaur, splendid condition, running order; trial given.—Kew, 160, Manor Park Road, Harlesden.

3½ h.p. White and Poppe Chater-Lea Cycle and forecar, Longuemare.—N. Vores, 170, Romford Road, Forest Gate.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

Along the Normandy Coast.

By W. H. THOMPSON.

HAVING enjoyed a two weeks' tour last summer along the Cote du Nord de France on my 1908 Triumph, I think that the few notes I made will prove interesting to readers of *The Motor Cycle*. As a member of the Birmingham M.C.C., which is affiliated to the A.C.U., I had no trouble in obtaining my special customs ticket, which saved me no end of worry the other side of the Channel.

With portmanteau strapped securely on my luggage carrier, and with satchel on my back, in which I carried a spare Rich detachable tube, repair outfit, and camera, I left Leamington at three o'clock on Saturday, July 25th, *en route* for Southampton, at which place I duly arrived at 8.30, after an uneventful but very pleasant ride. The road from Winchester to Southampton is one of the finest in England, both for scenery and surface, but the presence of one or two M.U. patrols showed me that it would be prudent to keep down the pace.

Crossing the Channel.

The boat was due to sail at midnight, so I had plenty of time to book passage and see to the "slinging on" of my motor cycle, and after attending to the inner man I went aboard.

Next morning I was awakened at seven by the "donkey" hauling in the cable or hawser; then a steward came and informed me we had arrived at Havre. I dressed and went up on deck, where I was met by a *mécanicien*, who doffed his cap and parley-voiced vociferously for about ten minutes while I stood patiently waiting for him to stop for breath. When he did so I discovered that he wanted my "triptique"

to pass my machine through the customs. He did all that was necessary, only calling me into the office when my signature was required. His next operation was to fill up the tank with petrol. Then he gave me his card, charged me a couple of francs, and sent me on the wrong road to Honfleur. After travelling about ten miles out of Havre I came to the conclusion that I was on the wrong road, so pulled up to ask the way of some peasants, but they wouldn't or couldn't understand me, so I produced my road map and asked them to show me where I was on the map, but they didn't know. Fancy that; didn't know where they lived!

A Return to Havre.

Shortly afterwards I came across a more intelligent person, and he sent me right back to Havre, to take boat across the Seine to Honfleur, and I arrived just in time to catch the eleven o'clock boat. Honfleur was reached after an hour's pleasant sail down the Seine. It is a very pretty little place, unlike most seaside towns in Normandy, inasmuch as the neighbouring country is well wooded. From Honfleur I rode on to Trouville, the "Brighton of France," where I stayed a few days at the Hotel d'Angleterre. This is a capital stopping place, and I received every possible attention from the proprietor and English-speaking waiter.

Leaving this charming seaside town, I rode to Caen and Bayeux, the road now being one of the "route nationales," with avenues at intervals, and a surface like a track. Now, ye speed enthusiasts, take your high geared twin-cylinder fliers over there. There is no speed limit. no police crouching behind hedges,

Along the Normandy Coast.—

and no dogs to pester one. It is the speed maniac's paradise.

Caen is a typically grey old Norman town, and worth a visit, as it is exceptionally well preserved. Bayeux, with its splendid cathedral and wonderful tapestry, interested me greatly, so I spent a day there, staying at the Hotel Luxemburg—a good house with reasonable charges. Taking to the road again, I passed through St. Lo and Coutances, only staying long enough to take photographs. Then on to Granville, where I was made very comfortable at the Grand Hotel des Bains. Granville is a very pretty place, with a fine view from the hill of the harbour and bay. But, oh, the smell!

roads round this place are the worst I have ever ridden on, and between Dinard and Dinan they are absolutely execrable. I returned direct from St. Malo to Southampton, and rode up to Warwickshire, my home.

No Necessity to Carry Tools.

Throughout this tour my machine never gave me the slightest trouble, not even a single puncture. I had taken the precaution to fit a new Goodrich tyre on the back wheel before starting, but the Brittany roads took all the rubber studs off and cut it terribly, but in spite of this rough treatment it carried me home. I have since returned it to the makers, and they have kindly sent me an extra heavy one, free of charge, and also retreaded my old one.

The Quay Street at Cancale.

Grand Rue, St. Malo.

Crossing the Rance in a sailing boat.
Dinard to St. Malo.

Go where you may you cannot get away from it; not a common everyday smell, but a mixture of onions, garlic, and paint.

A Motor Cyclist's Mecca.

My next important stopping place was Mt. St. Michel, which to my mind should be the Mecca of all tourists in Normandy and Brittany. Its one long street, crowded with quaint shops and cafés, winds upward to the church steps, where a guide is waiting to make up a party for inspecting the wonderful church, which in its time has been a prison, a fortress, and now has become a "monument historique" of France. I could not leave this place without paying a visit to the Hotel Poullard and tasting one of the famous omelettes. Madam Poullard, I believe, has retired from the business. I was loth to leave this most interesting rock, but the time was flying, and I wanted to be in St. Malo before lighting up time. I stayed at the Hotel Central Benoit in St. Malo, and I strongly recommend this house to any tourists who think of doing this part of France. The charge is most reasonable—7.50 f. a day, with a liberal table. I was made so comfortable that I stayed the rest of my vacation there, riding out to the various places of interest round St. Malo. The

My machine has been running in all weathers since January, and has travelled considerably over 3,000 miles, and I still have all the original parts, with the exception of back tyre. A good clutch would make it perfect, and as soon as the Triumph Co. market one I shall be one of the first to have it fitted. I should like to thank the secretary of the R.A.C. for the trouble he took in giving me all particulars I required regarding the tour, which went a long way towards making my holiday such a grand success.

The Churchill Motor and Cycle Co., 9, Churchill Place, Edinburgh, are, we are informed, taking up the agencies for Scotland of the Puch motor bicycles, tricars, and sidecars, and also the agency for the Dürkopp motor bicycle. The Puch is a well-known Austrian make which has performed most creditably in Continental competitions. It is well made and efficient, and easily ranks among Austrian high grade machines. Of the Dürkopp motor cycle not much has been heard lately, but of the few models that were seen over here a year or two back, the four-cylinder was one of the best designed of its type; having mechanically operated valves and variable inlet control.

The Nieuport Magneto.

A MAGNETO machine for motor cycles of which more will be heard in the future is the Nieuport. Its chief features, apart from its extreme lightness (3 lbs. 15½ ozs.) and the small dimensions (depth 4in., width 2½in., and breadth 4¼in.), are the simplicity and neatness of its design. The working parts of the magneto are shown in detail in the accompanying illustrations. On each end of the H-type armature is a circular bronze plate A and B carrying the shaft of the machine, on which are the ball bearings C on which the armature rotates. On the shaft are mounted on the one end a single collector D and on the other the condenser E, which latter in its turn carries the bell crank F (fig. 2) and platinum contact G. R is a platinum contact screw, which is adjustable. The primary winding has one end "earthed" to the armature core and the other end is insulated from earth and connected to the platinum tipped contact screw R by means of the centre screw O. The two poles of the condenser are connected, one to earth and the other to the contact screw R. The body H is formed of one piece of special non-magnetic metal, into which are cast by a special operation as part and parcel of it the two soft-iron pole pieces.

A pair of permanent steel magnets J are pressed over the body H on to the pole pieces, and are held in place by a brass strip. This strip is secured at

the base by means of four screws. A brass disc K supporting the steel cam L fits into the end of the body, and is held in position by the spring M bearing in the slot in the cam disc. Cover N held in position by the spring shown completely encloses the contact breaker.

If the terminal in the centre of the contact breaker cover be connected

to an earthed switch the primary current can be earthed, and consequently the action of the magneto controlled at will. This make of magneto can be supplied fitted with variable advance or for a fixed point of ignition, and also with either one or two

Fig. 1—The Nieuport Single-cylinder Motor Cycle Magneto, the lightest of its kind.

pairs of magnets. In the case of variable advance, double magnets are recommended. The Nieuport magneto is very easily dismantled. The outside cover is first removed, then the disc and cam. After taking out the high-tension terminal, and two grub screws holding the bearing in place, the armature can be withdrawn, but the agents, Van Raden and Co., Ltd., Coventry, point out that the armature should never be disturbed unless absolutely necessary, which advice applies to all makes of magnetos.

The steel spring S is very light, and consequently the wear of the platina infinitesimal. After continued running, if it is found necessary to trim up the points the small lever holding the bell crank is slipped aside, and the bell crank and spring can be taken off in a second. P is a fibre block in contact with the steel cam L. Oil holes with covers to exclude dust are provided for the two bearings. The Nieuport magneto should specially appeal to makers of motor bicycles desiring to reduce weight to the finest limit—and who cares to handle an unnecessarily heavy motor bicycle?

Fig. 2.—Showing the contact breaking mechanism. The cam L, operating the bell crank F, is shown in fig. 1.

Owing to the great increase in their business the Continental Tyre and Rubber Company have found it necessary to acquire land and erect an addition to their works at Willesden. The work will commence without delay to enable them to cope with next year's trade. The finest plant and machinery have been ordered, and when these have been installed the company may claim to have one of the finest equipped works of its kind in or around London.

A neat little booklet has reached us from the Triumph Cycle Co., Ltd., which contains a few extracts from the articles which appeared in *The Motor Cycle* last May and June, entitled "Motor Cycling for Health," being the opinions of medical men who are users of motor cycles. The booklet also contains some enthusiastic users' opinions of Triumph motor cycles, and a list of successes recently accomplished on this make of machine.

Passenger Machines at the Stanley.

By B. H. DAVIES.

FROM what the Yankee motor cyclist would term an "affinity" point of view the 1908 show was frankly disappointing in that very few complete passenger combinations were staged, and of those on exhibition only two or three appeared likely to appeal to a large public. In one respect, however, the show was a great advance on any of its predecessors; there were a great number of sound, substantial motor bicycles staged which were in every way fitted to pull a sidecar or push a forecar. For instance, five or six excellent gears figured on several machines—the Nala, N.S.U., Vindec, Rex, Chater Lea, and Roc. By the addition of any of those to one of the stronger $3\frac{1}{2}$ h.p. roadster bicycles or to almost any 5 h.p. twin a machine could be obtained eminently suited to sidecar or forecar work. Our old friend the $3\frac{1}{2}$ h.p. Phelon and Moore appeared in a lighter, more modern, and more comfortable form than it has ever taken before, with a simple design of handle starting, and its chain drive is undoubtedly superior to the belt for passenger work. I expect the majority of 1909 passenger combinations will have one of the above machines as their foundation. There was nothing new in detachable forecars, but sidecars evinced a few real improvements. Both the castor wheel and Montgomery types are procurable with side springing, and I particularly admired the Mills and Fulford device; this latter sidecar was at last fitted with a lock for the castor wheel—a device I first urged upon the makers eighteen months ago as necessary to prevent the side wheel opening outwards when the combination is wheeled backwards.

A Differentially Driven Sidecar.

The Bat cycle was very ingenious and attractive, but at £125 it cannot appeal to everyone. It consisted of an ordinary belt-driven Bat twin-cylinder bicycle, the separate use of which at will is always retained. The addition of a sidecar chassis converts it into a four-wheeler at any time; the sidecar chassis carries a differential axle, a large leather to metal clutch, a Chater Lea three-speed gear box, etc., and the coupling is so ingeniously worked out that when the belt is taken off the engine will drive solely through the transmission carried on the sidecar chassis. The Phänomobile (two rear wheels) and Rex Triette had not materialised at the date of my visit, but I may be excused for pointing out that the Triette corresponds very closely to my specification of the ideal tricar, as propounded at the A.C.U. discussion, and that whereas several gentlemen in the trade then said my specification was impossible at £70, the Triette works out at considerably less with a 5 h.p. twin engine. It is a great pity this machine arrived at the Hall so late; it is the type most likely to resuscitate the tricar.

Another excellent tricar seems born to blush unseen. It has figured at several Stanley Shows, and has possibly been the absolute pick of the basket in each year; but it is still comparatively unknown, partly because it is always tucked away in a corner of the Gallery, where it is missed by many, and partly because it is seldom entered for important trials. I refer to the 6 h.p. N.S.U.—a light, substantial, refined, and powerful mount, possessing an absolutely fool-proof

gear. I do not know why it seldom enters for big trials, as from my small acquaintance with it I am ready to wager I could bring it successfully through an End-to-end run, and it should be classed with the Triette as a trustee of the future of tricars generally. It bristles with neat and clever details, its workmanship is wholly excellent, and a purchaser of it will not need to disburse further money in extras. I might add it is fan cooled.

A Double Trailer Device.

I should like to know more of the Bransom rear car—an exhibit which most people seem to have overlooked. It is really a double trailer, which is rigidly attachable to any motor bicycle in a couple of minutes, the whole combination then forming a three-track machine, which steers like a tricycle.

The Zenette tricar was probably the most comfortable passenger mount in the show, its springing being unique, on the scissor hinge principle. I thought the low gear ratio (7 to 1) far too high for general work, and regretted the absence of a magneto in a machine costing £90, but, of course, good coachwork is costly.

Two other two-speed motor bicycles were exhibited suited for the attachment of light passenger devices, viz., the Brown and Chater Lea. Several air-cooled four-wheelers also figured in the show, such as the Chater Lea Carette, Vindec runabout, and the O.T.A.V. I sum up the potentialities of the show from an affinity point of view somewhat as follows:

1. Great improvements in two-speeded motor bicycles.
2. Several improvements in sidecars.
3. Appearance of a really efficient tricar at less than £70.
4. Annual debut of several freaks.

And so I expect to see on the road in 1909 a greatly increased number of light two-speeded sidecar and forecar combinations, among which I fancy the Rex and N.S.U. ought to be specially prominent.

A rider of a four-cylinder F.N. at the opening run of the season (Oct. 10th) of the South Australian A.C. from Adelaide to Bellair and back. A number of motor cyclists attended the run. The road appears to be a good one.

MOTOR CYCLING

IN NYASALAND.

A FEW members of the Motor Union of Nyasaland had a delightful and most successful run from Zomba to Fort Johnston on Saturday, September 12th, and back to Zomba the following day. The participants in the run used the following machines: 6 h.p. Bat-Jap, $2\frac{3}{4}$ h.p. Minerva, 3 h.p. Triumph, $3\frac{1}{2}$ h.p. Brown, and a $3\frac{1}{2}$ h.p. Minerva. Fort Johnston is about seventy-eight miles distant from Zomba, and since Nyasaland is somewhat deficient in the matter of railways as compared with the home land, and in the event of a serious breakdown one cannot be certain of finding a railway station a few miles off, those motor cyclists who contemplated taking part in the ride spent a busy time overhauling and tuning up their mounts a day or two prior to the start. One really smart repair was made. The owner of the 1907 Bat discovered that the big end bearing of the front cylinder connecting rod was fractured, and a new bearing had to be made—and was made, too—out of a piece of brass. Exactly how this miracle was accomplished with the aid of only the motor cyclist's ordinary kit of tools, plus a few odd files and things and the pluck and determination of the owner of the machine, the writer does not profess to understand—he was too busy with his own mount to go along to see—but it certainly was accomplished.

The Send-off.

Shortly after nine o'clock on Saturday morning we five riders took our departure amid the enthusiastic plaudits of the natives and the good wishes of the Europeans, many of whom, I half suspect, thought that at least one or two of us would spend the night within the confines of an odorous native hut, should one happen to be handy, or, otherwise, snugly ensconced in the arms of a tree, in order to be out of the reach of lions and other kittenish denizens of the forest land through which was cut a great part of the route we had to traverse. The road from Zomba to Fort Johnston goes first of all north-west to Liwonde (thirty-two miles from Zomba), on the east bank of the Shire river. The Shire has to be crossed at Liwonde, thence the road runs north along the west bank of the river to Fort Johnston (forty-seven miles from Liwonde). We in Nyasaland are rather proud of our roads, and, I think, justly so; but, of course, being "new," they cannot compare with our centuries old home roads. Nevertheless, the writer has motor cycled over many side roads in Scotland which were in a much worse

condition than Nyasaland roads are in the dry season. One advantage our roads possess over those in Britain consists in the fact that implements of puncture are seldom to be encountered. The roads are not yet macadamised, except in a very few places, and the few horses we possess are shod as nature intended them to be. The great majority of our natives, too, have not yet attained to the dignity of boots, and consequently they take care to keep the roads free from thorns for their own sakes.

Zomba is about 3,000 feet above sea level, and Liwonde only 17 feet; therefore the first part of our

Nine motor cyclists of Nyasaland who took part in the run described in the accompanying article.

journey was for the most part level or downhill. There is only one hill of any importance on this road, viz., Mkulu Hill (mkulu is a native word, which means large or great), about six miles from Liwonde. This hill is about a mile in length, with a grade of 1 in 15 for the bottom half and 1 in 16 for the top half: but none of our machines experienced much difficulty in negotiating it on the return journey. The surface is hard, and there are no nasty bends. It should, however, be borne in mind that motors cannot climb hills so well in Nyasaland as at home, owing to the great heat (150° in the sun is a common temperature, even in the highlands).

Baboons by the Roadside.

At the bottom of Mkulu Hill a colony of baboons was encountered. They did not seem to be a bit afraid of us, but stood at the side of the road and quite close to it, watching us pass apparently with keen interest.

Motor Cycling in Nyasaland.—

The 3½ h.p. Minerva arrived at Liwonde first, doing the journey in eighty minutes (an average of twenty-four miles per hour), and the others arrived soon afterwards. Minerva's spurt proved to be its undoing, however, for it arrived with a broken sparking plug, and when we tried to remove this we found it impossible to do so, as it was burned tightly in the valve cap. This machine had therefore to remain behind at Liwonde. At this place we were joined by a rider of a 1908 Triumph. After lunch we filled up with petrol out of a tin which we had sent on in advance, and after being ferried across the river by natives in an iron barge commenced our forty-seven miles ride to Fort Johnston. In a couple of years time this road to Fort Johnston will be a most excellent one for motoring. It is practically level, all streams are well bridged, and except for one or two awkward bends, which will be straightened soon, is very straight. At present, since a great part of it is "new," the surface is a little soft in places, but since all the natives who travel between Lake Province and the Shire Highlands use this road, in a very short time these soft places will be beaten hard by the tread of countless bare feet. Mile posts are in course of erection, and the danger points—that is, the sharp bends, for there are no other sources of danger—are marked with warning posts, as at home. For about three miles at the Fort Johnston end it is about thirty feet broad and beautifully surfaced with a most suitable "binding" sand obtained from the Shire. The natives in the Liwonde and Fort Johnston districts had evidently heard that "white men" were going to travel along the road on their "bicycles of fire," for at different places dozens were congregated, and the clapping of hands and howling and shouting drowned the noise of our silencerless engines as we passed. One urchin got so excited that he let go a sheep he was holding in order to clap his hands, and the animal promptly scampered across to the other side of the road to where its mates were, to the imminent danger of both the sheep and the motor cyclist, whose front wheel grazed its tail.

The Arrival at Fort Johnston.

About twenty-seven miles from Fort Johnston we were met and welcomed by two more 1908 Triumph riders. Here we waited till all stragglers arrived, and then went on in a body to our destination, where we arrived three hours after leaving Liwonde. After a most welcome bath and change of attire we dined with the district Resident, and thereafter adjourned to the club, where we met with practically the whole of the residents of the township. This club, with its billiard table and piano and magazines, must be a great acquisition to the place. The township itself is nicely laid out and very clean, and such buildings as the Queen Victoria Memorial Tower and church at once arrest attention. How different the whole place is from the Fort Johnston the writer knew in 1894-5! That Fort Johnston was situated on the other side of the river and three miles nearer to Lake Nyasa in the middle of a swamp, and deaths from malignant malaria and blackwater fever were so common that one ceased to think much about them. We had an impromptu concert in the club, and thereafter the Resident, in a little speech of welcome, said it had now been demonstrated that an organised motor

ride from Zomba to Fort Johnston in a few hours was possible. Our beds were made and mosquito nets rigged up on the deck of the *Monteith*—a stern wheel river steamer. There was a wooden deck above us, but nothing at the sides to prevent the balmy breezes from fanning us, and as we were all tired, it did not take long for the lapping of the water and the jumping of the fish to lull us to slumber. Next morning early we visited the Government Marine Transport and African Lakes Corporation's engineering shops, and also the private garage of one of Fort Johnston's keenest motorists. Here we managed to become possessed of a few of such useful motor accessories as washers, spanners, trouser clips, oilcans, asbestos string packing, rubber solution, etc.

The Return Journey to Zomba.

After breakfast no less than nine motor cyclists were photographed in front of the Resident's house, including we four from Zomba, three riders of 1908 Triumphs, one N.S.U., and one Roc. Most of our friends accompanied us part of the way on our return journey. We departed from Fort Johnston a little after nine o'clock, and, having now a better knowledge of the road, we simply flew along where we knew it was safe to do so, and arrived at Liwonde in two hours, averaging quite twenty-five miles per hour, after deducting the time spent in bidding good-bye to our Fort Johnston friends about twenty-seven miles out. Five miles from Liwonde the Brown engine, unfortunately, seized, owing to the opening of the drain tap at the bottom of the crank case, and the rider had to slip off the belt and pedal to Liwonde. After crossing the river and lunching we took the engine to pieces with the view of putting matters right, but our efforts were in vain, owing to the want of suitable tools, so we put the engine together again and sent the machine on to Zomba under charge of a couple of natives, and the rider followed in a machila (hammock slung on a pole and carried by natives).

Except for this mishap our ride was in every way an unqualified success, nothing at all going wrong with any of the machines. By the time we had finished assembling the Brown we had barely two hours of daylight left us in which to get over the thirty-two miles of uphill road to Zomba, so we let our mounts travel as fast as they would go. Twelve miles from home we overtook a Zomba resident who had been spending the week-end shooting on the river, and whose push bicycle, on which he had been riding home, failed him. He had tramped a long way, and was tired, so he was found a seat on the luggage carrier of the Bat and whirled along to Zomba. Thus ended one of the most enjoyable runs the writer has ever taken part in.

ONE OF THE FOUR.

With reference to our article, "The Path of the Magneto Current," in the issue of November 25th, page 928, the Bosch Magneto Co., Ltd., point out that it is their opinion that if motor cyclists do not understand the magneto it is the riders' own fault, as from time to time they have given publicity to the fact that they are prepared to send gratis on application a printed description of Bosch magnetos, giving full working details. The booklets referred to are particularly well got up, and explain the principle of high tension magneto ignition in a most clear and lucid manner.

A Commentary on Mr. B. H. Davies' Paper on Tricars.

IF one might be allowed to comment upon the very interesting paper read by Mr. B. H. Davies before the A.C.U. on the above subject, I should like to do so as regards several of the points discussed.

Cost.

Mr. Davies thinks £70 the absolute limit of price for a successful light tricar. To approach this figure he sacrifices water cooling, which is more or less essential for the satisfactory working of the engine. If the air-cooled engine is going to receive the necessary current of air, it means that the driver has got to tolerate an unenclosed and bleak position, with a blast of wind playing directly on and around his feet and legs from the numerous eddying currents, thus making driving a misery except in warm weather, to say nothing of the dust and grit thus drawn up. He also suggests fan cooling, but in the majority of cases fans again create a draught, and in my opinion are an abomination and a miserable makeshift at best. A perfectly efficient and no-trouble thermo-syphon water-cooling system, involving but another £5 at most, ensures a more efficient engine, and comfort and protection for the driver. Surely the majority of riders will concede this point.

Type of Frame.

Mr. Davies implies that all open frame tricars have hitherto been "whippy" in action. I have only ridden two or three makes, it is true, but I have never noticed any whip, and my present machine, which has a Perry frame, fitted with trusses or girders, is to my knowledge perfectly innocent of the fault, there being no tendency towards whip at even over 30 m.p.h. This is an ordinary unsprung frame.

Transmission.

The lecturer submits that the ideal transmission must have two speeds. While thoroughly in accord with him as to a reverse being unnecessary on a light machine, I quite fail to see why he disapproves of a three-speed gear. Surely three speeds are better than two, other things being equal. In order to leave a safety margin in the employment of a two-speed gear, it must be so proportioned that the low gear will successfully tackle any gradient which is likely to be met with. This means that about 50% of the gradients climbed on the low gear could have been climbed quite easily on an intermediate gear had there been one. Then why decide to have none of it while there are such splendid, simple, and foolproof examples on the market (as, for instance, the Oppermann), which have proved themselves to be all that can reasonably be desired, giving a wide range in the choice of gears? This being so, I fail to see eye to eye with Mr. Davies on this point.

Brakes.

As regards rear brakes, what can be simpler and better than a pedal operated metal band (with vulcanite blocks attached) engaging an eight-inch metal drum, the same surrounded by a metal shield as a protection from road dirt and wet? This particular system has never failed me yet, and will hold me on practically any hill with full load, and, in combination with powerful front brakes and the low gear in engagement, I feel absolutely safe. The suggestion of a dummy belt rim is, to say the least of it, a trifle crude.

The Single-cylinder Engine.

While agreeing with the chairman as regards the price of a good light tricar (£80), I submit that his verdict on the single-cylinder engine is an unjust one. If a "single" is such a horrible jumper, it is very surprising to find dozens of first-class car makers entering the arena with single-cylinder cars (both British and Continental), and selling them like the proverbial hot cakes, and it is self-evident that these models are increasing in popularity. The fact is that their flexibility is wonderful, also their comfort and freedom from vibration, and in the hands of an intelligent driver their behaviour leaves nothing to be desired. The drawbacks to a "single" are not, in my humble opinion, nearly sufficient to warrant the extra cost and complication of a twin for a popular light tricar. Surely if the majority of motor cyclists are contented riders of singles, as they undoubtedly are, the average light tricarist is not going to loudly demand a twin on the grounds of vibration; more vibration is absorbed in a tricar frame than is ever likely to be in that of a motor bicycle. I cannot refrain from mentally comparing the above gentlemen's sentiments with the behaviour of my 4 h.p. single White and Poppe water-cooled engine, which does more than everything I can in reason demand of it, and is, indeed, an everlasting marvel to me. My gear box (Oppermann three-speed) has gears of 5, 9½, and 14 to 1, and thus equipped I dare go anywhere with my passenger, whom I have never yet had to shed. All jumpiness in the engine is eliminated by reason of the very range of gears Mr. Davies would discard. For instance, if circumstances demand a speed of less than eight miles per hour, or even ten miles per hour, the second speed is brought into action in perfect comfort without recourse to the low gear, which might produce unnecessary vibration, and would in any case mean aggravatingly slow progress. Mr. A. F. Ilsley hits the right nail on the head when he says that more should be heard concerning the surviving satisfactory light tricars of to-day.

Capabilities of a Light Machine.

I think Mr. W. Randle is wrong when he sweepingly asserts that a light machine would only do for a twenty-five mile run if he refers to the 4 cwt. machine. The type I am here championing is capable of doing many thousands of miles with perfect comfort to its users, provided correct springing is given due attention, and this could be embodied with very little extra expense. Springing is, after all, a matter of taste, it being quite possible to build a serviceable unsprung machine without it shaking to pieces.

In conclusion, I would state that I have no pecuniary interest whatever in the articles I have mentioned by name, my object being solely to further the light tricar movement.

P. H. MEERS.

We are in receipt of the latest catalogue of Messrs. Siemens Brothers, of 12, Queen Anne's Gate, Westminster, S.W. Messrs. Siemens are the vendors of every kind of ignition accessory, but their speciality is the "Obach" dry cell, which is highly recommended for motor cycle ignition. Special coils are also sold intended for use with these cells.

LETTERS TO THE EDITOR

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

The Editor does not hold himself responsible for the opinions of his correspondents.

Explosions in the Silencer.

[3704.]—With reference to the enquiry of "C. C." in *The Motor Cycle* of November 25th, I may say that I had exactly the same trouble on my $3\frac{1}{2}$ h.p. Minerva. I got over the difficulty by removing the silencer altogether, or rather the bell of it, and fitting a larger one. This shows that the trouble is caused not by a bad silencer but simply by too small a one. I have not the least signs of the trouble now. The ignition on my machine is by accumulator and coil.

S. R. RAFFETY.

Unrolled Stones.

[3705.]—Cannot something be done to prevent the authorities from leaving unrolled stones on the roads for weeks on end? All the roads round here are being "repaired," which consists of laying stones and leaving them there to be ground. This is Cambridgeshire. All motor cyclists who ride at night know how dangerous new metal is, and it seems unfair that a public authority should be allowed to ruin the roads and endanger the lives of night riders without protest. We know how easily tyres are destroyed by loose stones, and so long as the roads are good enough for the sleepy drivers the authorities (some of them) think they have done that is necessary.

CEDNIV 5.

Two-stroke Motors. A Club's Decision.

[3706.]—Considerable interest was taken in connection with the awards of the Coventry Motor Club's hill-climb at Newnham, owing to the fact that a two-stroke machine was entered and secured first place in the particular classes, and some difficulty was anticipated in applying the rules governing the contest as regards making the awards. The matter was referred to the A.C.U., and thoroughly threshed out with it and the committee of our club, and in your issue of November 11th, in Club News, was made the announcement of this club's decision that the published awards should stand. As I find that some of the competitors do not seem to have had this notification, I shall be glad if you would publish it.

ERIC W. WALFORD,

Hon. sec. Coventry Motor Club.

Mounting by the Pedal.

[3707.]—I noticed in a recent issue of your most delightful paper in "Hints and Tips," under paragraph 265, the author makes a statement which I fully endorse, "To mount by a swinging pedal is a method almost certain in time to lead to disaster."

I came a cropper some time ago by missing the pedal while mounting, and this led me to fix up a step on the machine which I find, to a great extent, minimises the risk of a spill in mounting.

I enclose a sketch of the device which I think would be easily applicable to most makes of machines. Those riders who retain pedals and who occasionally use them to assist the engine if adopting this method would require to fix the step sufficiently far back on the frame to clear the heel of the boot while pedalling. The sketch shows the step carried by two members of the frame. This method of fixing I use on a lightweight machine built of thin tubing, but is unnecessary on the average strong motor cycle frame.

ES 158

Dry Batteries.

[3708.]—In your issue of November 4th we notice a letter signed "Jack Kneiff," who states that he uses dry batteries (cost about 3s.) and can do about 2,500 miles with each.

Now batteries like these would be worth having, as we have some thirty-five motor cycles running, which we have to supply with dry batteries, and we have tried every known make, and the best we can do is from 600 to 800 miles on a set of three. If Mr. Kneiff would kindly oblige with the manufacturer's name we should be very much indebted to him. We think if dry batteries can be got to do such good service at such a small cost that both magneto and accumulator ignition will take a back seat.

Toronto.

TANGENT CYCLE CO.

Tandem Attachments.

[3709.]—In answer to "C.M.F.," my experience of tandems proper and tandem attachments is just large enough to make me infinitely prefer the tandem proper to the tandem attachment, on every score except that of cheapness. I will contrast my opinions of the two types tabularly as follows:

TANDEM PROPER.

Comfortable.
Easy to mount.
Easy to start.
Passenger keeps clean.
Does not skid.
Weight inside wheelbase.
Steering delightful.

TANDEM ATTACHMENT.

Uncomfortable.
Awkward to mount.
Awkward to start.
Passenger gets very dirty.
Skids horribly.
Weight all upon rear wheel.
Front wheel hops.

I sympathise with the owner of the tandem, the engine of which was controlled by the non-steering passenger. He must have been the largest sort of juggins. I am sorry, for "C. M. F.'s" sake, that I dislike the tandem attachment, about which he is so enthusiastic, but my lady passenger does not wear bloomers, and the side-saddle-pillion type of rear attachment is not one that many girls or many men will ever favour.

B. H. DAVIES.

An All-British Machine.

[3710.]—I read with interest your correspondent's letter "An All-British Machine," and I certainly think his is an isolated case. I have always been a rider of British machines, which include two Rex, two Humbers, one Stevens, one Rover, and four fitted with J.A.P. engines, and I can truly say I have never had a serious break with either engines or frames, the only breaks at all being two inlet springs and two exhaust valves, which I think is a good record for all-British stuff.

I have ridden a 6 h.p. Bat-J.A.P. for the past eight months for business and pleasure nearly every day without an engine stop, and have found it as reliable as a push bicycle.

I hope your correspondent will be satisfied with the twin Continental when he gets it, for while my all-British has been behaving itself perfectly this year, I will give you the happenings to three machines of foreign make owned by friends. First, a single-cylinder of good make developed a cracked valve seating, which meant scrapping the cylinder. Second, a twin of well-known make pulled up suddenly one day with a smash; result, broken connecting rod and piston smashed to pieces. Third, a single-cylinder, with automatic carburetter, never could be got running properly, which resulted in getting a British carburetter. My order next year will certainly be

ALL BRITISH.

Dome Topped Pistons.

[3711.]—With regard to the Triumph piston. illustrated in *The Motor Cycle* of November 25th, I may say that I fitted my motor bicycle—which was home-made—with rings similar to this five years ago, and made the piston dome shaped. I altered it afterwards and made it concave. I fitted two rings at the top and one ring below the gudgeon pin, so this is no new idea to me. My piston is similar to the drawing enclosed. I tried one ring at the top and one at the bottom but found the piston much better with two rings at the top and one at the bottom.

E. CATTELL.

[3712.]—I fail to see the advantage of the domed piston fitted to one or two of the leading makes for 1909. I am told that the oil will drain off the top of the piston to the cylinder walls and lubricate the cylinder better. This may be so for the first few miles, but the oil will drain from the centre of the piston head as far as the top piston ring, where its progress will be arrested. There will therefore be an accumulation of oil round the outside edge of the piston head, especially just when the engine has stopped after a run, and this being when it is most heated.

This accumulation of oil round the edge of the piston will then form into carbon deposit. This formation of carbon deposit on the outer edge of the piston will very soon become sufficient to prevent the oil draining from the top as far as the cylinder wall. Not only this, it will gradually continue upwards until it has reached the centre of the piston head, and then there will be a flat surface of carbon deposit all over the piston head, and then where is your dome-shaped piston?

Also is it not a mistake to make a piston the same diameter all the way over? Is it not better to make it with a slightly smaller diameter in the middle, to enable oil to accumulate there, and so well lubricate the cylinder? **FLAT TOP.**

[3713.]—With reference to Mr. B. H. Davies's article in your last issue on the subject of "Roadster Motor Bicycles at the Stanley," your contributor appears unaware of the fact that domed pistons, pistons with a ring at the lower end, and pistons with rings with a step-cut joint, have one and all been used on well-known cars for years. It is therefore hardly fair to car designers to say that the special pistons shown at this exhibition will be widely copied on cars. It is rather the other way about; and I may add that it was some two years or so back when I first suggested to members of the trade that car practice could show them something in this respect.

Mr. Davies mentions the Douglas, but he says nothing of their piston, which has been specially turned with oil grooves and spaces to ensure efficient lubrication in what certainly appears to be an effective way. **J. W. G. BROOKER.**

[Both the convex and concave piston in connection with motor cycle engines are much older than Mr. Davies or Mr. Brooker appears to imagine.—Ed.]

A Problem to be Solved.

[3714.]—I have been much interested of late in various letters in your paper with regard to two engine phenomena. Your American correspondent, Mr. Ovington, obtains what he calls an abnormal condition by the use of copious oil in his four-cylinder, and only obtained this condition when he can get a good start as it were down hill. But is this condition abnormal? I have read the views of your many correspondents, and am convinced that the condition is merely one of perfectly normal efficiency. That it is not common is the fault of the designs and users of modern engines. Any well-designed engine should attain this condition which is dependant only upon obtaining a high maximum r.p.m. and many engines have done it, notably Mr. Ovington's four-cylinder F.N. and the old 4 h.p. twin Werner. Anyone who has heard the latter engine pass from a buzz to a roar, and then to a high-pitched singing note, knows that the average engine falls short of ever really obtaining the maximum efficiency obtained only at maximum r.p.m. The 2½ h.p. J.A.P. will do something very like it. Now, the notable part about these engines is that they all are extremely light in the reciprocating unit, and in this fact, I think, lies their faculty of obtaining an "abnormal" condition.

With regard to an increase of speed on slightly lifting exhaust valves. This is a common symptom which I personally have experienced on two machines. My theory is that it only is observable at fairly high engine speeds, and is due to the natural spring in the human fingers overcoming and neutralising the inertia set up by the chattering of the valve upon its seat. The finger pressure is not strong enough to keep the valve off its seating when it should be closed, but it assists and softens the cam action and softens the rebound of the spring.

I think we should probably find that where this symptom occurs the machine could take a little less clearance between stem and tappet and a slightly longer duration of valve opening with advantage. This view of the subject is the one held to my knowledge by several well-known experts, and as the matter has caused me much wonderment on former occasions, I think it well that it should be explained if possible.

BERNARD SIFFKEN.

Motor Cycling in New Zealand.

[3715.]—I think perhaps a few lines on motor cycling in New Zealand may be of interest to some of your many subscribers. The province in which I reside is called Canterbury, and the plain extends for many miles without a hill of any sort; hence the very heavy machine is not much used here. The motor bicycle is fairly popular, and there are a fair number about. There are practically only four makes of machines on the market, namely, the Triumph, F.N., Minerva, and Brown, but owing to prices being so absurdly high there are not nearly as many motor cycles on the road as there might be. After studying your most excellent paper, *The Motor Cycle*, and reading of the wonderful performances of British-built motor cycles, I have often wondered why the manufacturers cannot see their way to put their machines on the market here at something like a reasonable price. Many British machines are practically unknown here.

Another thing I should like to point out is that, so far as I can see, most of the lightweights are built with the idea of running them on your nice smooth English and Continental roads. Here in New Zealand the roads are smooth only in places. In other parts the less said about them the better, but they are bad enough to shorten the life of some of the otherwise splendid lightweights very considerably; so I think if manufacturers, when consigning machines, light or heavy, to the colonies, would consider that our roads are not good, they might then build their machines to withstand better the knocking about they receive.

W. L. S.

Canterbury.

Magneto Manufacture.

[3716.]—With reference to the Premier Accumulator Co.'s letter [No. 3701] in your issue of December 2nd, may we claim a little more of your valuable space in order to reply to this company's remarks.

We think if the writer of this letter had studied Mr. Jackson's letter [No. 3657] and our reply, he would not have written exactly as he has; but, in any case, it would appear that little result would accrue were we to again go over the various points in rotation as he has done. We therefore propose to place before your readers one or two questions.

1. What is the most popular form of ignition apparatus at the present time?

We think that the fact that the Bosch magneto claims this distinction cannot be disputed by any person.

2. What is the reason for its popularity?

The answer to this question would be found in the fact that the Bosch Magneto Co. was at any rate one of the pioneers of the magneto industry, realising at a very early stage of the motor movement that something better and more reliable than coil and accumulator was necessary for the ignition of internal combustion engines, and, having realised this, got to work and passed through the experimental stage while electrical engineers in this country were all saying that magneto ignition would never come into vogue. Surely one is not out of place in stating that English manufacturers lacked enterprise, and in this connection it is interesting to note that the editor in the issue of *The Motor Cycle* dated November 11th stated that the largest British electrical firms are somewhat apathetic with regard to motor ignition.

With regard to your correspondent's statement that the writer of our previous letter has a great deal to learn, this is

not disputed for one second, but in any case we are now manufacturing more than fifty different types of magnetos, and all are necessary to meet the various requirements of the motor cycle and motor car industry, and when the gentleman who is responsible for the statements made in your letter has gained a little more experience in connection with his machine, and the difficulties attending the marketing of same, we feel sure that he will take a somewhat different view of the situation. It must not be supposed for one moment that there was any intention in our previous letter to convey the meaning that the Bosch Magneto Co. is the only firm that can manufacture magnetos. This is not the case, but one thing is certain, and that is that no reasonable-minded man would specify a comparatively unknown type of ignition for his motor cycle when he can have a magneto of undoubted reliability at the same price.

The position of the magneto industry in this country is much the same as the motor car industry was some years

The miniature Max made its second appearance at the Stanley Show in an improved form. The engine pulley is geared down, permitting the use of larger pulleys. The engine is of 2 h.p., with Simms magneto, and the carburettor controlled from the handle-bar.

ago, when Continental companies had such a tremendous lead in the design and manufacture of motor cars, and we paid those Continental companies the highest compliment in copying their designs; precisely in the same way would-be manufacturers of magnetos in this country have not struck original ideas for themselves, but have purchased Continental models and copied them. The latest instance that we can call to mind in this connection is the fact that in one year no less than three firms have made a very close imitation of the Bosch dual ignition apparatus. This fact in itself is the greatest proof that the designs and methods adopted by the Bosch Co. are considered to be the best, otherwise they would not be so quickly copied by their competitors.

THE BOSCH MAGNETO CO., LTD.,
ARTHUR E. BENNETT, Technical Manager.

Motor Tricycles.

[3717].—As a student of cycling, and of an age that precludes me from attempting to ride a motor bicycle, I have often wondered why motor engineers have not given more consideration to motor tricycles. I for one would be glad to see manufacturers attempting to put on the market a tricycle with single wheel in front and driven by belt or gear to back axle. Is it too much to hope for? There are hundreds of persons who would become devotees of motor tricycling if a good pattern machine could be placed on the market. Personally, I have visited the cycle shows of this country from time to time, and with regret cannot even see or hear of an attempt at putting one on the market. Will not some enterprising firm take this matter up?

A TRICYCLE RIDER.

The Abingdon Works Co., now the Abingdon-Ecco Co., placed a single steering double driving tricycle on the market about two or three years ago, but it has not been heard of lately.—Ed.]

Motor Cycling in Australia.

[3718].—Motor cycle doings in South Australia are going to boom this year. We have now two clubs—the Automobile Club of South Australia and the newly formed motor section of the Norwood Cycle and Motor Club. Both these clubs have had their opening runs, and a great muster took place at each. The Automobile Club has just elected a new secretary, who promises plenty of sport; while the Norwoods are out already with a list of club runs and contests, and all motor cyclists are looking forward to an enjoyable season. The Norwood held its annual dinner recently, and it proved to be the most successful ever held. Programme and report sent under separate cover together with "Automobile Club Year Book" and a copy of our newly inaugurated motor journal, *The Australian Motorist*. This is a Victorian journal, although its future editions will devote a page or two to South Australia contributed by one of our own scribes. From the papers sent you can see we are fully alive as regards motor cycling and motoring in general, and I hope to send some good accounts as the various events are decided. I am a member of both clubs, and between them we are to have a run every Saturday, our first contest to take place next month (November), the nature of which is not fixed yet.

We have some beautiful scenery and places of interest, mostly or nearly all in hilly country, and let me say here that our hills are rather more severe than those often mentioned by you. The road surfaces and corners are a great deal worse, and on the flat we have no long stretches of nice smooth roads one so often reads about in your valued journal. However, we colonials are a jovial lot, and I can assure you the motor cyclists here enjoy life to no small tune, even under our poor touring conditions, to say nothing of the prejudice of the anti-motoring public, who are always too ready to over-estimate the speed and carelessness of motorists in general.

The machines mostly in use here are single cylinders, the Minerva still being the most popular. The local makers build their own frames with Minerva engines, and although they all or nearly all call the machine by their names, the bulk of the engines used are Minerva 2½ h.p. Magneto ignition is now almost universal. Twin cylinders, mostly Peugeot, are becoming more popular, and F.N. four-cylinders have a few enthusiasts. Also a local make called the Lewis, water-cooled, is well pushed. Lightweights are not altogether a success. Our roads are not good enough for that type, although they are good machines in their way; they are unsuitable for the rough work they are put to. The N.S.U.'s have come on of late with a rush, and, of course, like any new make well boomed, have caught on, but it is too early yet to comment on them. Personally, I fear they are geared far too low—about a 3½ in. engine pulley and a 21 in. belt pulley—for our warm climate.

As to our riders, we have some good ones—exceptionally good—and I will turn up some of our records at an early date. Those I can remember are: Mile track record, 1m. 5s. (not on a Brooklands track, but on our Oval, about three laps to the mile, and not highly banked); hill-climb up a severe hill, bad surface, and numerous bad turns, average gradient 1 in 8½ for two and a half miles, at the rate of twenty-eight miles an hour; reliability run of sixty-four miles over all sorts of country, penalty one point for every minute ahead or behind at controls—some secret ones, too—one rider gained maximum points (100) besides numerous instances where riders have ridden hundreds of miles over some very bad roads and beaten the railway trains, in one instance with a passenger on a M.H. carrier over 100 miles and then beat the train by a good deal.

Adelaide, South Australia.

SAMOTOR.

EXPERIENCES WANTED.

"T. F." (Ireland) would like to know the name of a really reliable non-skid tyre or detachable cover for winter riding.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

Occasional Comments

"By Ixion"

Running with the Wind.

My postbag contains an interesting letter from the owner of a $1\frac{3}{4}$ h.p. F.N. He complains that makers' advertisements exaggerate the average speed which can be maintained with lightweight machines in general, his opinion being that sixteen to eighteen miles per hour is their limit. My own experience differs from his; I find that if stoppages are excluded I can easily keep up a legal limit average with any lightweight I have tried; but that on an all day ride the average usually works out at his figure, owing to stops for meals, punctures, and belt adjustments. Secondly, he says lightweights are very susceptible to the direction of the wind. This is obviously true. An ordinary steady breeze travels at about ten or twelve miles an hour. If a motor cycle is travelling with the wind at, say, sixteen miles an hour there is very little draught playing on the engine, and the conditions approximate to those under which an engine is run on the stand. At the same time this trouble can always be met by slightly more generous lubrication than usual. He concludes with a well deserved eulogy of the geared down pulley fitted to the 1908 F.N. lightweight. I wonder if he noticed a geared down variable pulley on an accessory stand at the Stanley. It looked rather a good thing to me, though I have yet to try it on the road.

Hill-climbing in Ceylon.

Any reader who is thinking of taking a motor cycle out to Ceylon should undoubtedly select a low compression engine, assisted by a variable gear, for a Ceylon motor cyclist tells me that the country is rich in terrible ascents—"jumping snakes could not get up some of them." The roads keep curling round and round upon themselves, and he mentions one ascent thirteen miles in length, with an average grade of 1 in 12, and frequent patches of 1 in 4, 5, 6, and 7. This is Sutton outsuttuned indeed, or most "suttonly" a genuine hill.

Ingenious Carburetters.

From a number of drawings I have seen recently it appears possible that the carburetter of the future may embody some mechanical devices. Already a good many carburetters incorporate spring actuated devices roughly resembling an automatic inlet valve, and just as the automatic inlet valve is gradually disappearing from engine practice so the automatic valve on carburetters may presently be supplanted by a more positive device. I saw several special hill-climbing machines at various events this year, which contained mechanically operated fuel or air feeds, and there is now to hand a design in which a very simple form of mechanically operated valve increases the flow of petrol in exact proportion to the speed of the engine. The advantages of such designs are increased flexibility, absolutely automatic action, and the removal of the inertia inseparable from atmospherically operated valves.

The Silent Knight Engine.

Many motor cyclists found their way to Olympia, and instantly made tracks for one of the three Silent Knight engines exhibited there. Our hopes that the Minerva people would shortly produce an air-cooled sample of it were greatly intensified by a view of a sample engine cut open, and revolved by hand. Our distrust of the two concentric sleeves within which the piston works was reduced to a minimum when we saw for ourselves the low speed and short travel of these sliding sleeves. On the big stroke sample staged the travel of the sleeves did not exceed an inch, and would be slightly less on a 3 in. stroke, while the speed of the sleeves was correspondingly slow. I suppose the whole question, from a motor cycle point of view, is simply whether the friction entailed by the design is too excessive for a miniature engine or not; and I do not for a moment suppose the friction will be excessive, since the power curves of the big Daimler engines are apparently better than any secured from a poppet valve engine of similar capacity. *En passant*, I hear that other designs of slide valve engines are likely to make an appearance before many months are past.

Vaporising of Lubricating Oil.

One alleged explanation of Mr. Earle L. Ovington's F.N.'s occasional fits of abnormal speed is the vaporisation of lubricating oil at very high temperatures. About six years ago I had an experience with a 10-12 h.p. Darracq car, which the experts told me could only be explained on a similar supposition. We ran short of lubricating oil, and travelled a dozen miles or so on a scanty supply of a very thin oil, which, if my memory serves me rightly, was actually salad oil. On entering our garage, the engine refused to stop when the accumulators were switched off. I promptly shut off the petrol tap, but the engine continued to fire away merrily, knocking and pounding in a way which threatened a broken crankshaft. In this dilemma I got a huge wrench, and unscrewed the inlet pipe at its union to the carburetter. By this time two or three minutes had elapsed, but the engine still refused to stop. Finally I got out another spanner, intending to take out a valve, and just as I started work the engine at last ceased firing. Several experts told me the engine had been vaporising lubricating oil, and I think they must have been correct, as the oil used must have had an extremely low flash point.

Whilst one of the 1909 pattern Rex Motor Bicycles was undergoing trial, it came into sudden collision with an obstacle, and the frame was twisted in the manner shown. Despite the strain, it did not give way at any point.

IN PRAISE OF A PASSENGER MOTOR CYCLE.

By ED 232.

MANY motor cyclists are now considering the question of their 1909 mount, and possibly a passenger attachment for same. To these the following details and photographs of a unique combination of which I am the proud

and satisfied owner will no doubt prove interesting. I should first of all remark that I did not work up to my present 6 h.p. twin-cylinder machine through a series of gradually increasing horse-powers in single-cylinder machines like most motor cyclists. No! In my earlier motoring days I looked askance at a "common" motor bicycle. In spite of a strictly limited income, nothing but a real genuine motor car would do. So one fine day, after

parting with 180 carefully saved and hoarded "Jimmy O'Goblins," I became the proud owner of a two-seated 6 h.p. single-cylinder motor car, with three speeds and reverse, capable of about thirty miles per gallon and a top speed of about twenty four miles per hour. A list carefully kept of the expenses incurred made quite a formidable total, and I decided at the end of the first year it was more than I could afford.

Experiences with a Tricar and Motor Bicycle.

So I sold it, and with the money realised I invested, on the score of upkeep, in a 5 h.p. single-cylinder chain-driven tricar of well-known make, with coach-built and well sprung front seat, but rigid frame and back seat. This was speedier and far more economical than the car, but oh! the agony of that back seat over

Passenger about to enter sidecar.
Driver and passenger seated.

Starting the engine by means of the Roc clutch and handle.
Now we're off. Goodbye!

In Praise of a Passenger Motor Cycle.—

any but the best roads, the excessive vibration owing to the three tracks, the inaccessibility and the unsociability of it! Once again I made use of *The Motor Cycle* sales columns.

What next? Well! my wife told me not to bother about her, but get a motor bicycle. So my next venture was a 1908 Triumph, and as a single this was all that could be wished, but after a time, knowing that the partner of my joys and sorrows was left lonely at home, the suggestion of a sidecar was gladly received. Of course, that meant a two-speed gear and free engine. Should I fit these to the Triumph, or sell it and buy a machine with these improvements already fitted?

A Machine for Sidecar Work.

I decided to buy a new machine, so once again my "auto" was for sale. And then, glad day! I purchased a two-cylinder 5 h.p. Roc motor bicycle, Peugeot engine, with Roc two-speed gear and free engine clutch, and it did not take long for me to discover I had got a good thing. No sudden dismounts in traffic! Instead, just take the high speed gear out of action with a touch of a pedal, bring machine to rest with the brakes, and put one foot down, with engine running and throttled down by handle-bar levers; then, with the road clear, gradually press the pedal, and off again, without the usual shove to start and leap into the saddle. I found the bicycle capable of doing fifty miles per hour, or two miles per hour on the low gear—which gives a 50% reduction—and about 80 miles to the gallon of petrol. Next came the question of a sidecar attachment. Which kind is best? Fixed, flexible, or castor wheel? All had their champions, but none really pleased me. I noticed an illustration of the Lowen patent two-wheeled sidecar in *The Motor Cycle*, and as this was evidently on the right lines I got one, and fitted it to the Roc, and here at last I found all I wished for. When attached to the motor bicycle (a matter of five minutes at the outside, with patent spring bolts, no tools of any kind being needed) the wheels run in track just as any other four-wheeled conveyance, the front steering wheel of sidecar being coupled with the steering head of bicycle. Running on four wheels, there is, of course, no vestige of side strain; the seat is beautifully sprung, roomy, and well upholstered; the front is brought up to height of passenger's knees, and side doors are fitted like a car, making a completely draught-proof well for the protection of the passenger. The sociability of the sidecar is a great point in its favour, and conversation is easy. Both the front forks of the bicycle and those of the sidecar are suspended on springs, which, of course, means added comfort to passenger and driver. I use a rin. Whittle Link Grip belt, as this is the only one I have found equal to passenger work.

License Fees £1 10s.

A trailer license is required in addition to the motor cycle license, making 30s. in all. The petrol consumption with two up works out about seventy miles per gallon. Forty miles per hour is the top speed with sidecar, and I have yet to find a hill it won't surmount on the low gear. I would like here to answer two objections frequently heard of late against the Roc machine and gear, which makes me wonder if they are at all inspired.

First, handle starting. I find no difficulty in this, because, before attempting to start up by handle, I

inject paraffin to loosen the pistons. This being accomplished, I have no trouble in rotating the engine at a good speed, as the engine is geared up. Provided everything is in order, the engine fires as soon as the valve lifter is released.

Secondly, slipping of brake bands. I have not experienced this even on steep hills with a weight of 7 cwt.

Most of the correspondents who complain of slipping write of oil leaking out of the gears and getting on brake drums and bands. If they mean ordinary engine oil, no doubt they have trouble. The gear case does not require to be "oil" tight, nor is it so. The proper medium for lubricating the gears is "grease" or "graphite gear grease," which is a "solidified" oil, and never becomes sufficiently liquid to run out of the gear case, or get on the drums or brakes and cause slipping.

Finally, as to the cost, the outfit illustrated cost me about £80 with all accessories. A 4 h.p. single-cylinder machine and less elaborate body to sidecar would reduce the cost considerably. The Lowen sidecar is adjustable in every direction, and will fit any make of motor bicycle. It is strongly constructed, and the method of attachment is good. I can thoroughly recommend this combination to anyone anxious to possess a satisfactory passenger outfit, two or four-wheeled at will. I may add I have no interest in either the motor bicycle or the sidecar mentioned other than that of a well-satisfied owner.

A RELIABILITY TRIAL IN AMERICA.

EARLY last month the New York Motor Cycle Club held a so-called endurance contest over a course of 150 miles of hilly and most treacherously slippery road. Sixteen riders were entered, and at the end of the run America had

Two N.S.U. riders who made non-stop runs in the New York M.C.C. endurance contest.

one perfect score and a few battered ones, which, however, was sufficient to beat the team representing Europe, which team, however, had two perfect scores. The motor cyclists upholding Europe's reputation were D. Molin (6 h.p. twin N.S.U.) and Fred Voelker (3¾ h.p. N.S.U.). They are portrayed in the above illustration.

MOTOR CYCLES AT THE
PARIS SALON.

PASSENGER MOTOR CYCLES.

TIME TO LIGHT LAMPS.—Dec. 9th, 4.50 p.m. ; Dec. 12th, 4.49 p.m. ; Dec. 16th, 4.49 p.m.

Demand for Motor Cycles.

We are informed on good authority at the output of a certain firm of motor cycle manufacturers in Coventry has been booked up to the end of May next.

Interest to Birmingham Riders.

A local reader asks us to warn motor cyclists that the police and magistrates at Acocks Green Court, Birmingham, are rabid anti-motorists, and riders passing through that district should be extremely careful how they proceed.

The Most Powerful Tricar.

The tricar illustrated on this page, we should imagine, the most powerful three-wheeler at present on the road. It is propelled by a 16-20 h.p. Mutel four-cylinder engine, 4 in. by 5 in. bore and stroke, and has a carburetter, pump circulation, and clutch, accumulator ignition

The World's Hour Record.

The A.C.U. Competitions Committee at its last meeting had before it the claim for the Hour Motor Cycle Record recently made at Brooklands by Mr. C. R. Collier. The distance originally returned was 70 miles 105 yards, measured from the 50ft. line, but as the Union rules stipulate that motor cycle records made at Brooklands shall be taken from the 10ft. line, the committee has decided that it can only recognise the distance as 67 miles 1,655 yards, which record has been duly passed. Even now, there is a good margin between Giuppone's previous best.

A Prominent American Motor Cyclist in England.

On Wednesday last Mr. Earle L. Ovington, president of the Federation of American Motor Cyclists, was entertained at dinner at the Royal Automobile Club by several prominent mem-

The Vanderbilt Cup Race.

One of his most interesting experiences was when he, in company with other motor cyclists, were told off to keep the course clear during the recent Vanderbilt Cup Race, and to appreciate this it must be mentioned that from all accounts American crowds are more than unruly. Neither police, special constables, nor volunteers with unloaded rifles served to keep the throng back. But a few motor bicycles continually driven as fast as possible with cut-outs open, at anyone who happened to be in the way, were he spectator or constable, worked wonders. According to the narrator, the effect was quite wonderful, and the crowd just melted away.

Amateurs and Trade Riders.

Another point under discussion was the misunderstanding that has arisen in the institution which Mr. Ovington represented, concerning the amateur question. Our readers will remember that Mr. T. K. Hastings, the popular American, got into trouble with the Federation through competing with English professionals. On Wednesday evening the definition of a "private owner," as drawn up by the A.C.U., was pointed out to Mr. Ovington, with the result that the matter is now in a fair way to be cleared up. It may be stated with practical certainty that in future, American amateurs will be able to come over and take part in our competitions without fear of suspension.

A Meeting at Brooklands Suggested.

Mr. Ovington is particularly anxious for the A.C.U. to arrange an international, or rather an inter-American, motor cycle race at Brooklands in the Spring. After some discussion it was suggested that the competition should be an hour race, open to single-cylinder machines having a capacity not exceeding 500 cubic centimetres, and to twins having a cubical capacity not exceeding 1,000 c.c., Mr. Ovington being of the opinion that these limits should be the standard for all A.C.U. competitions. Mr. Ovington is agent for the F.N. motor bicycle in the United States, and has done much to popularise that excellent machine in his country. He has expressed himself to be delighted with London, and is much gratified at the manner in which he has been received over here. Such meetings as these do much to cement friendly feeling between nations. Would that our attempts to promote international contests between certain continental countries had met with greater success. If the Americans do come over they will be certain of a hearty welcome.

A 16-20 four-cylinder tricar on substantial lines owned by Mr. Wm. E. Gibson. A specification of the machine is given in a paragraph on this page.

high tension distributor. Two forward speeds are arranged on two cross-shafts behind the engine, and the final drive is by chain. The wire wheels are fitted with 810 by 100 mm. Dunlop tyres, and, as may be expected, are standing well. All wheels are sprung on long laminated springs, and the frame is of channel steel. The petrol tank is behind the seat. Easy removal of the back wheel has been provided for, without undoing the main or interfering with brake or other adjustments. The owner, Mr. W. E. Gibson, of Teddington, tells us that the tricar gives no trouble, and he drove it from Edinburgh to Teddington a few weeks ago.

bers of the Auto Cycle Union Committee. Those present were Mr. Robert Todd, chairman, Mr. Ovington, Mr. F. Straight, secretary, and Messrs. W. H. Wells, A. G. Reynolds, and E. M. P. Boileau. After dinner Mr. Ovington regaled the party with some delightfully told experiences of motor cycling in the United States, and stated his views on British and Continental machines. He regarded these, especially the British productions, as being far superior in every respect to those in use in America, but to use his own words, he considered that the American racing machines would make the British motor cycling public sit up and take notice.

News from All Points of the Compass.

Readers and correspondents of *The Motor Cycle* are scattered all over the world, and the present issue alone contains motor cycling news from New Zealand, South Australia, Tasmania, Nyasaland, South Africa, Canada, Ceylon, Vancouver, Long Island, America, Normandy, Brittany, France, Germany, Denmark, and Belgium.

Track Race in the U.S.A.

In a 100 miles race at Birmingham, Alabama, on the 24th ult., Robert Stubbs, of that city, won, completing the distance in 1h. 47m. 44s. The track was a dirt track with practically no banking. Stubbs rode a 5 h.p. twin-cylinder Indian. The speed works out at about 55½ miles per hour.

A Projected Race Meeting.

A motor cycle race meeting under the auspices of the Federation of American Motor Cyclists was to have been held recently over the Long Island Motor Parkway, but the President of the Federation declared the weather was too cold. A race meeting on a big scale, however, will be held early next year. The new Long Island Parkway differs from Brooklands in that the course is practically straight. The surface consists of concrete, and the track is reserved exclusively for motorists.

Serious Fire at Halifax.

We learn that a somewhat serious fire occurred at the premises occupied by Mr. E. Farrar, Albion Works, Square Road, Halifax, on Thursday night last. The fire, it appears, broke out about 11.20 p.m., and spread to the storey above, occupied by a firm of underclothing manufacturers. The damage to Mr. Farrar's stock was considerable, several motor cycles and a quantity of tyres and accessories having been completely ruined. Those of our readers who have goods on order from this firm will doubtless give them a little extra time in which to supply.

A Correction.

We regret that there are one or two errors in Mr. H. Hewitt Griffin's analytical abstract of motor cycles exhibited at the Stanley Show and published last week. With regard to the

Rex machines, the whole of the thirteen machines shown were fitted with magneto ignition, not battery ignition, eight single-cylinder Rex machines had M.O.I.V., and five twin-cylinder machines A.O.I.V., instead of thirteen M.O.I.V. Also eight of these machines had pedals instead of four. In the case of the Vindec motor cycles, a number of these were shown without pedals, whereas the table gives all Vindecas as with pedals. The same remarks apply to the Triumph motor cycles.

Hunter, 45, Park Street, Bristol, and has not since been returned. It has magneto ignition, Palmer tyre on back, petrol pipe bent out of original shape, no struts from girders to crown. Any reader who is offered this machine for sale is asked to communicate immediately with the police or with Mr. Hunter.

Damages for a Motor Cyclist.

At the Wandsworth County Court, on Friday last, Costa John Malakates sued the Motor Cabs, Ltd., of Queen's Road, Battersea, for £73 19s. damages for personal injuries, injuries to a motor cycle, and loss of income, due to an accident caused by the alleged negligence of defendants' motor cab driver. The judge said there was no doubt that the accident was caused by the failure of the motor cab driver to drive in a proper manner, and awarded plaintiff £21 damages.

Motor Cycling in Vancouver.

Mr. R. Boxer, a well-known motor cyclist of Brockley, S.E., and a successful amateur in competitions, has just returned from a four months' visit to Vancouver. He took his De Dion Bat with him, and despite the high freight and duties did not regret it. Most of his riding was done in and around Vancouver, where he stayed with relations. He states that there is an eight miles limit in the town, and a fair number of motor cycles and cars are used.

French Motor Cycle Exports.

It is worthy of note that while all the French automobile exports for the first ten months of this year are down, the motor cycle exports are up. The figures quoted in *La Voiturette* are motor cycle exports 1906, 1,242,000 francs; 1907, 674,000 francs; and 1908, 1,128,000 francs, an increase over 1907 of 454,000 francs. This is all the more remarkable when one considers the difference in quality and design between the English and French models. France must have found a market for French made motor cycles which England ought to be able to easily secure for herself unless the prices asked for the French machines are too low to allow England to compete.

FUTURE EVENTS.

- Nov. 28 to Dec. 13—Paris Salon Exhibition of Motor Cycles, Cars, and Accessories.
Dec. 10.—Essex M.C. Paper by Mr. H. G. Cove on "Motor Cycles, Accessories, etc."
" 12—Motor Cycling Club Annual Dinner.
" 16—Motor Union General Committee Meeting.
" 19—North West London M.C.C. Second Annual Dinner and Distribution of Prizes.
Jan. 7—(Provisional) Essex M.C. Paper by Mr. H. M. Wyatt on "Magnetos."
" 16-23—Motor Cycle Show at Madison Square Garden, New York.
" 20—Auto Cycle Union Annual Dinner, preceded by the Council Meeting.
" 23—Essex M.C. Annual Dinner.

Germany's Foreign Trade in Motor Cycles.

During the first ten months of 1908, both Germany's purchases and sales fell off in comparison with a like period in the foregoing twelve months. The imports fell from 22,900 to 20,900 kilos. This means a difference of over £600. Belgium succeeded in slightly increasing her exports to Germany. Germany's exports underwent a marked change, her sales dropping from 173,500 to 116,300 kilos. The official valuation being 750 marks per 100 kilos, the values fell from 1,301,250 to 872,250 marks, or, expressed in English money, a fall of more than £21,400. England, however, purchased more motor cycles, although only a matter of 14 cwts. The exports to Denmark dropped from 24,800 to 11,300 kilos. In all, Germany exported 773 machines fewer than in 1907.

Another Motor Cycle Stolen.

On Saturday, November 28th, a 1½ h.p. lightweight N.S.U. motor cycle was obtained on appro. from Mr. C. A.

The Burry Lightweight exhibited at the Paris Salon. The absence of any form of silencer will be noted.

The Alcyon Lightweight at the Paris Salon. Note the position of the magneto and silencer.

THE PARIS SALON.

WHEN we visited the Paris Salon last week we found the Grand Palais, that beautiful building in the Champs Elysées, in which are exhibited the motor cars, motor cycles, pedal cycles, and accessories, shrouded in a dense fog, which, according to those who have spent a lifetime in Paris, was unprecedented.

As in previous years, the main floor of the building is devoted almost exclusively to motor cars, and the motor cycle stands, what there are, are to be found in the galleries, there are also nearly all the accessory exhibits.

The Grand Nef, or main hall of the building, has lost, in our opinion, none of its splendour, the interior lighting may be reduced in the number of actual lights, but the general effect remains just as artistic as ever. The exhibitors themselves also vie with each other in the decoration of their stands, and a contemplation of the main part of the show, by, from the balcony, at any time after the stands are illuminated, presents the same enchanting spectacle as in previous years. With regard to the motor cycles on exhibition, they are, speaking generally, very far behind the British motor cyclist's ideal. Of course, there are the same firms exhibiting as have already shown at the Stanley, such as the Moto-Rêve, F.N., Motosacoche, etc. We do not propose to deal with their exhibits in this article, and our remarks must be taken as alluding to the general run of French motor cycles which are seldom heard of or ridden in this country, and which were not exhibited last month at London.

With few exceptions, the French motor cycle maker is obviously looking to the lightweight motor bicycle to resuscitate a business which he has sadly neglected for some reason which is beyond our ken. That there is a big market to be developed in motor cycles in France we have not the slightest doubt, but at present the motor cycle business is in the hands of two or three firms at most, who do not appear to

THE MOTOR CYCLE EXHIBITS.

The Société Industrielle d'Albert exhibit a Rochet-Bruneau lightweight. This is chain driven through a reducing gear and counter-shaft, the whole transmission being enclosed in metal case. The magneto is fitted behind the engine, and chain driven. This machine was exhibited last year, and remains unaltered.

The Alcyon lightweight is a new model. The F.N. type cradle has been discarded in favour of an ordinary diamond frame, presumably to allow space for the magneto, which is chain driven. The belt transmission on this machine is of the direct type without reducing gear. The engine is of 2 h.p., with mechanically-operated inlet valve (see p. 972).

The Griffon exhibit is a representative one from the French point of view, but the alterations in design and equipment are so trivial that it is unnecessary to go into the details of

The 2 h.p. Lurquin and Coudert Motor Bicycle. The 1½ h.p. is exactly the same in appearance, but of course lighter.

construction of these machines, which in their 1907 form are already well known to our readers. The bevel gear driven magneto is still retained, the magneto machine being enclosed in a compartment of the tank.

Although Humber, Ltd., show a full line of pedal bicycles through their French agent, they do not include a motor cycle, which is to be regretted, as we think that there would be a demand for good British machines, now that they are so much in advance of those made in France.

have made any great efforts to keep their products up to date. For instance, it is an uncommon sight to find a machine fitted with a handle-bar controlled carburetter; there are one or two exceptions to prove the rule, but the old style levers on the tank are universal. Such articles as stands and luggage carriers are practically unknown, and the saddles are, in the majority of cases, more suited to path racing requirements than those of the touring or road riding motor cyclist.

We searched in vain for footrests, and as for pedal applied belt rim brakes, admitted to be the best retarding device for a motor cycle, they were non-existent. Magneto ignition is fitted to several machines, but it is nothing like as universal as in England. Numerous machines are exhibited with battery ignition, and the enquirer is informed that magnetos can be fitted to order, but in many cases the engine has not been designed to take a magneto, and the attachment of the magneto machine would to all appearance be somewhat of a makeshift. Passenger motor cycles are few and far between; one or two tricars are shown, such as the Austral and Quentin, but we failed to find any new makes, while those on view have undergone little or no alteration. The change-speed gear question does not appear to have ruffled the mind of French manufacturers, and where a variable gear is fitted, it is usually the Bozier, which, as our readers already know, is an epicyclic gear attached to the engine-shaft. One or two ingenious methods are employed for reducing the gear by means of a counter-shaft to enable engine pulleys of large diameter to be used.

If any of our readers should pay a visit to the Salon, and wish to first see the motor cycles, they should make for the balcony and tour the whole of the outer gallery; then take the *salles* in order of lettering, A to X, not missing the Salon d'Honneur. Then they should descend to the Rez de Chaussée, and afterwards, if time permits, to the main floor.

The Lurquin-Coudert show two models—a 1½ h.p. and a 2 h.p. Both are lightweights with magneto ignition, and are so much alike that we only find it necessary to illustrate the 2 h.p. They both have magneto ignition, the magneto being fitted in front of the crank case, and chain driven, automatic inlet valves being retained.

J. Duperrut shows a light motor bicycle called the "Burry," which emanates from that home of the lightweight, Geneva. The engine is inclined forward with horizontal radiating fins on the lines of the Motosacoche, the carburetter being between the engine and the gear-driven magneto. The method of inclining the engine and casting the support for the magneto on the top of the crank case makes a neat combination. The transmission is by V belt, and both valves are mechanically operated. The wheels are both 24in. diameter. The engine is devoid of a silencer, and the machine has only one brake (see p. 972). It is provided with handle-bar control for the carburetter, and is the only one in the show so provided, with the exception of the Moto-Rêve, Terrot, Motosacoche, and Triumph, which latter is on exhibition in one of the rooms in the Gallery. It is quite refreshing to come across this solitary example of a British-made complete motor cycle, showing its French competitors such a very clean pair of heels.

Magnat, Debon, and Moser show a machine very like the Burry described above. The engine is inclined forward, and the magneto is similarly situated and driven; but the engine is fitted lower in the frame, and the radiators are at right angles to the cylinder, and round instead of square. The engine appears well made.

The arrangement of engine and magneto on the Magnat-Debon Lightweight.

The Paris Salon.—

René Gillet and Co. have quite one of the best exhibits of motor cycles in the Salon. This firm is not very well known, but its machines are as well designed as any of the French models on view. With the addition of a V belt drive instead of a flat one, and magneto ignition, they would be quite passable. The design of the rear frame allows for a very low seat. The tricar is one of the twin-cylinder bicycle models, with a detachable forecarriage and sprung front axle. On this stand is also a twin-cylinder tandem motor bicycle, which we illustrate.

The Quentin tricar, which is illustrated below, is one of the best examples of a water-cooled tricar in the show. It has a pressed steel frame, thermo-syphon water-cooled

The Quentin Tricar. A French production which is on exhibition in the Paris Salon.

engine, with magneto ignition. The transmission is by chain from a Bozier gear box on the engine-shaft to a large chain sprocket on the rear wheel. The sprocket is equal in diameter to a driving belt rim, and is attached to the road wheel by means of steel brackets or plates, which are riveted to the sprocket and the tyre rim. The front axle is sprung, and the coach-built seat is directly attached to it without the intervention of springs.

Herdtlé and Bruneau, the makers of the little water-cooled lightweight motor bicycle, have a good exhibit of all their models, which have been previously described in these pages.

Gallien-Sarda exhibit the Werner motor cycles. The lightweight and twin-cylinder models are exactly the same as last year and call for no special description.

In the Salon d'Honneur Les Fils de Peugeot Frères show all their models—the lightweight, $3\frac{1}{2}$ h.p. single, and the 5 h.p. twin, the two last named being provided with Trufault suspension spring forks. They are all the same as last year with the exception of the lightweight, which is now fitted with a magneto.

Terrot and Co.'s motorette is a 2 h.p. lightweight with inclined engine, magneto at the rear of the cylinder on top of the crankcase on the lines of the Magnat-Debon. The transmission is by round twisted belt, and there is a jockey pulley to maintain the tension. The throttle, which is contained in the inlet valve dome, is controlled from the handle-bar. The weight of this machine is 94 lbs.

The Moto-Rêve and Motosacoche machines on exhibition are exactly the same models as those we described in the report of the Stanley Show, as is also the F.N. The latter firm, however, show a forecarriage attached to one of the four-cylinder models, but with a two-speed gear.

H. J. Harding has an excellent display of J.A.P. engines and carburettors, Chater-Lea frames, Watawata

belts, etc. He told us that the French reception of the J.A.P. engines was favourable, and he expected to do good business with them.

The G. and A. carburettors for motor cycles are now made with the petrol union on top of the float chamber instead of underneath, so, it is claimed, preventing flooding and waste. The air control by means of metal balls of various weights is, of course, retained.

The Montbard-Aulnoye firm, who make a speciality of pressed steel pistons, have some nice little pistons on exhibition suitable for motor cycle engines. They are beautifully made, very light, and exhibited machined ready for use.

An article which calls for mention is the Fixator, a device for locking nuts; it is also used for controlling the movement of levers, such as throttle and air levers on handle-bar. We expect to illustrate this in the next issue, as well as one or two other interesting accessory articles which space prevents us dealing with in this issue.

A. Sommaire exhibits a $2\frac{1}{4}$ h.p. lightweight, a 3 h.p. single-cylinder, and a 5 h.p. twin-cylinder minus pedals. These machines have rigid forks, round petrol tanks, and battery ignition.

The Moto-Bécane is a lightweight attachment for pedal bicycles, shown by Albert Brunet. The machine exhibited had a special motor cycle frame, and we doubt if the attachment would fit any pedal bicycle without a good deal of alteration, particularly to the back and chain stays.

The Mea magneto hails from Stuttgart, and appears to be a well-made small and light magneto machine very suitable for motor cycles.

The Nilmelior Co. (late Bassée and Michel) make another magneto machine with four magnets, and an entirely enclosed metal contact breaker.

Paul Lavigne makes a speciality of a small motor cycle engine 68 x 70 mm., with a.o.i.v., weighing about 30 lbs.

On the Buchet stand, the only pattern of motor cycle engine on view is the old single-cylinder with overhead valves and separate combustion head. There is not even any arrangement made for driving a magneto.

The arrangements in the galleries are far from satisfactory. First, they are extremely cold, draughty, and badly heated with a few gas stoves. The motor cycle stands are difficult to find, and instead of all the motor cycle exhibits being classified and placed in one section of the Gallery, or Rez de Chaussée, they are dotted here, there, and everywhere in these two portions of the building. The catalogue contains a host of useless information, and three or four plans, which might be made quite serviceable if the names of exhibitors and numbers of stands had been printed in a type that was legible without the aid of a magnifying glass.

The Rene-Gillet Tandem. The transmission is by a flat leather belt.

CLUB NEWS.

Bocardo M.C.C., Oxford.

The annual dinner will be held on Tuesday next.

Leyton M.C.

The above club is a recent formation, and a special meeting to be held this evening (Wednesday), at 8.30, at "Lord Lyde," Capworth Street, Leyton, to elect the committee, pass the minutes, arrange fixtures, etc.

Birmingham M.C.C.

On Wednesday next, the 16th inst., a committee meeting will be held at 6.30 p.m. At eight o'clock the same evening a smoking concert has been arranged at headquarters.

Liverpool M.C.

The above club will hold their annual dinner at headquarters, the St. George's Restaurant, on December 16th, at 7 p.m., when the prizes won in the various competitions during the year will be handed over to the successful riders.

North-west London M.C.C.

The second annual dinner of the North-west London M.C.C. will be held on Saturday, December 19th, at the King's Hall, Criterion Restaurant, Piccadilly, W., at 6.30 p.m. sharp. The president (Mr. W. H. Pidgeon) has kindly consented to occupy the chair.

Western District M.C.

The annual dinner and distribution of prizes of the above club will be held at the Milford Hotel, on Tuesday, December 15th, at 7.30 p.m. Tickets may be obtained from members of the committee. Single tickets 5s., lady and gentleman 9s. The annual meeting will be held on Jan. 8th, 1909.

Leeds M.C.C.

At a committee meeting held recently, it was resolved (the previous whist drive was such a success) to hold another one on December 17th. Will all members make a note of this, and endeavour to obtain tickets for the fixture, which can be had from any member of the committee.

S.E. Auto Cycle Association.

Mr. Renner informs us that the above association, which was formed early this year, and which was the first association to cater for unattached motor cyclists at 5s. subscription, giving full legal and touring facilities and association with the Auto Cycle Union and Royal Automobile Club, has made satisfactory progress, and is about to issue a list of pairers and hotels (who recognise the machine badge) for every town of importance in the kingdom.

Nottingham and District M.C.C.

An extraordinary general meeting of the above club was held on December 4th, twenty-seven members being present. The minutes of the last general meeting having been read and passed, the chairman outlined the circumstances which had necessitated the calling of the meeting. The first proposition was, "That the following addition be made after the word committee in Rule 4: But it be distinctly understood that such small cars do not compete in motor cycle and quadcar competitions." After much discussion, the following amendment, proposed by Mr. Johnson, was put to a vote and carried by twenty votes to five against: "That Rule 4 shall in future be: The club shall devote its attention only to motor cycles, triars, quadcars, and small cars. The decision of the committee as to what constitutes a small car shall be final. No small car, quadcar, triar, or sidecar shall be allowed to compete in any event organised for motor cycles. For the purposes of competition for specially donated prizes the rules provided by the donor of the prize shall prevail over this rule."

Proposed by Mr. Holmes, "In Rule 6 the words January 1st, 1910, be substituted for the words January 1st, 1909." Carried after due discussion without any amendment. The rule now stands altered to: That the annual subscription payable on January 1st shall be 7s. 6d. for motor cycle members, and 10s. 6d. for car members, with an entrance fee of 5s. for those joining on and after January 1st, 1910, etc. The thanks of the meeting were due to the hon. solicitor to the club, Mr. R. A. Young, for his able and useful advice.

Cardiff M.C.

A committee meeting was held at the Queen's Hotel on the 1st inst., Lord Ninian Crichton Stuart (president) in the chair. It was decided by a postal vote of the members to

affiliate to the Motor Union of Great Britain and Ireland for 1909. It was reported that the medal awarded by the M.U. to this club had been received and was on view before the meeting, and a resolution was passed thanking the M.U. for same. The annual dinner of the club will be held during the first week of February, probably the 3rd, when Lord Ninian Stuart has kindly promised to preside and distribute the prizes and medals won in competitions during 1908. On the proposition of Lord Ninian Stuart it was resolved, "That the secretary be asked to write the secretaries of all other motor and motor cycling clubs in Wales and Monmouthshire with a view of calling a joint meeting of representatives of these clubs to discuss the advisability of forming a Welsh Automobile Union." The Chairman, in his introductory remarks, stated that both Scotland and Ireland had what might be termed "national" unions or associations, and he did not see why Wales should not have its own union also. It was suggested that if it could be so arranged the joint meeting should take place on the afternoon of February 3rd. A vote of thanks to Lord Stuart terminated the business.

Cambridge University M.C.C.

The following have each been awarded a silver medal in connection with the above club's meeting at Brooklands on November 7th: J. Ashworth (single-cylinder handicap), R. G. Heyn (twin-cylinder handicap), E. H. Lees (three-lap race), and B. Milburn (twins over 76 mm. bore). The medals were very kindly presented by Mrs. Moreing, Esher.

Sheffield and Hallamshire M.C.C.

Under the presidency of Mr. F. Dover, supported by Mr. T. Turner (secretary), the Sheffield and Hallamshire Motor Cycle Club held its fifth annual dinner at Hudson's Restaurant on the 3rd inst. Over a 100 members were present, and the evening in every respect was a marked success. The club is progressing and numbers 125, the new members enrolled during the season being 25. Seven competitions were held, the club expending about £30 in prizes. The winners of this year's competitions were then presented with their prizes by Miss Doris Dover. The Land's End to John-o'-Groat's medals were presented by Mr. J. W. Gould, on behalf of the A.C.U., to Messrs. F. Dover and J. Haslam. Mr. F. Dover also received the Triumph medal.

Members are reminded that a general meeting will be held at headquarters to-morrow, the 10th inst., regarding affiliation to the A.C.U. or M.U.

Stockport and District M.C.C.

The first annual dinner of the Stockport and District M.C.C. was held at the Mersey Hotel on Friday, December 4th, when about thirty-four members and friends were present. The president (Mr. W. Slater) occupied the chair, and was supported by the vice-president (Mr. A. Mugeli).

After the loyal toast, proposed by the President, Mr. Woodrow proposed "The Health of the President," and this was heartily drunk.

In responding, Mr. Slater said that Stockport was a good sporting town, and it was thought that it might support another organisation, and so the S. and D. M.C.C. was established. The club had only been formed at the early part of the year, but it was hoped it would develop into a strong and healthy organisation.

The President then presented the prizes to the winners of the petrol consumption test.

The toast of "The Treasurer and Secretary" was submitted by the President, who testified to the services rendered by Mr. Rogers and Mr. Marsden. These two gentlemen replied, and Mr. Marsden mentioned the fact that the membership was close on thirty, and hoped it would be doubled next year. He expressed regret at the death of Mr. Smith, a vice-president of the club, who was a very keen motorist.

Mr. Mugeli proposed "The Club," and remarked that a town like Stockport could not remain long without a motor cycle club. The club offered many advantages to motor cyclists, and its members greatly appreciated the benefits they derived from their connection with it. Motor cycles had become very popular of late, and it was only reasonable to suppose that with the improvements which were being made this form of locomotion would appeal to the public in an increasing degree; in fact, he believed that in time motor cycles would become as popular as push cycles.

Mr. Arthan proposed "The Visitors," and Mr. Sutherland responded.

Questions

and Replies

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E. C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Pitting of Contact Points.

? I have a 2½ h.p. F.N. motor cycle, and am much troubled by the contact points in the commutator (make and break) burning badly after about five miles running. The pitting is on both points (platinum), causing stoppage. I am using a twenty ampère 4½ volts accumulator, non-trembler coil. Will you kindly advise me as to cause and remedy?—H.K.

The trouble is either due to the coil, the condenser of which does not work properly, or to the contact points being of spurious metal, not platinum or iridium. Have the coil overhauled by a good electrical firm if you find that the fitting of new points of genuine metal does not cure the trouble.

Engine Timed Too Fast.

? There is a loud knocking in the front cylinder of my 5 h.p. Rex motor cycle. Be good enough to tell me the probable cause. I also find the machine too fast. It must have a high speed on before it will start. Is it possible to time the engine to work slower? I would much prefer if the machine was not so speedy.—F.J.E.

The trouble may be due to pre-ignition caused by excessive carbon deposit or loose gudgeon or crank pin. It is highly probable the engine is timed too fast. The timing can be retarded by altering the position of the sprocket on the armature shaft. If you are a novice a local repairer will alter it for you in a few minutes. You do not state what the ratio of gearing is. If you reduce the gear the machine will be more tractable.

Belt Slip and Adjusting a Magneto.

? (1.) What is the best thing to do with the round belt on jockey pulley when it slips? (2.) I have a Bosch magneto DA 1., fitted on my Moto-sacoché. Is it necessary to remove contact breaking disc when platinum points want cleaning? How is such removed, and how is it again affixed?—E.M.Q.

(1.) Give the belt two or three extra twists to tighten it, adjusting the jockey pulley as tight as possible. If this does not cure the slipping, probably a new belt and a new pulley are all that can be done. (2.) It is better to take off the contact breaker, but the platinum points can be faced by inserting a thin flat file between them, gently moving it backwards and forwards. To remove the contact breaker there is a central screw which is removed by the aid of a special spanner supplied with

the magneto. If contact breaker is tight it can be gently prised off with a screw-driver, but great care must be used, as it is a good fit. A key is provided, so that it cannot be put back wrongly. Thoroughly clean away all traces of oil and examine the heel of the bell-crank for wear.

Timing of Spark and Preventing Flooding of Carburetter.

? I have a 3 h.p. motor cycle. To have engine timed properly should I set spark lever dead centre and have points breaking when piston is exactly at top of compression stroke? When I advance spark, does the explosion occur before piston is at top of compression stroke, or is the engine running so fast that piston is over the top before explosion occurs? What is the cause of petrol spraying from float chamber of carburetter (Longuemare) when machine is running fast?—J.B.

We presume you refer to accumulator ignition, in which case your method of timing the spark is quite correct. The reason for this is that the complete combustion of the charge occupies a certain amount of time, that is to say, that until the piston reaches the top of the stroke the maximum force of the explosion is not exerted. There is also a certain amount of lag in the ignition to overcome; this is done by advancing the time of the spark, so that the break occurs earlier at the contact. To prevent the petrol spraying from the float chamber, see "Motor Cycles and How to Manage Them," 12th edition, page 38. This book can be obtained, price 1s. 2d. post free, from *The Motor Cycle* Offices, 20, Tudor Street, E.C.

Mr. T. H. Straker, the indefatigable secretary of the Hull and East Riding A.C.C., who was presented with a gold watch at the annual dinner in recognition of his services to the club.

Knocking on Hills.

? I have a 4 h.p. Aster-engined motor cycle, Longuemare carburetter, and automatic inlet valve. For the last few weeks it has refused to climb hills efficiently, so a few days ago I took out the exhaust and inlet valves and had them re-ground. Compression is good, as I can stand on the pedal for several seconds. On the level it will do the best speed, but half-way up a hill the engine slows down, and if I open the throttle full starts knocking badly until I retard the spark right back, when of course it will not finish the hill. Would using a thicker oil be any use? I have been using oil out of a Vacuum B tin, but it seems to me very thin, and pours out very quickly in comparison to some heavy oil I used a few weeks ago.—L.K.H.

The trouble is probably due to the cylinder head and piston being covered with carbon deposit. If you have the engine carefully cleaned out we think the trouble will cease, but we should advise you to use a thick oil specially prepared for air-cooled engines.

Tail Lamp Jolting Out. Compression.

? The paraffin tail-light on my rigid frame tricar goes out if jolted, and I have to stop frequently to light it. I put an inch thick rubber pad between the lamp bracket and frame of tricar to take the shocks from the lamp, but still it is jolted out. The wick is long enough, and does not go down. Any hints to overcome this difficulty will oblige. Suppose my single-cylinder engine is running well, what results may I expect if I (1) increase the compression by removing the 1-16th washer (supposing such washer to be present) from between crankcase and cylinder, and (2) decrease the compression by inserting another 1-16in. thick washer?—INQUISITIVE, N.B.

A back lamp is always a bother on an unsprung tricar, and we regret we can offer no solution to the difficulty, but you could no doubt arrange a sprung lamp bracket on the machine. You could also try an electric lamp, but be very careful that the connections are made as firmly and as carefully as possible. If you increase the compression you will probably get more power and more vibration; if you reduce the compression the engine will run more sweetly and give less power. If the engine is running well you had better leave things alone, because you would have alterations to make to the valves or tappets if you varied the space between cylinder and crankcase.

An Electric Hand Lamp.

?

Please give me your opinion on the merits or otherwise of employing a motor cycle dry cell with an ordinary test lamp attached to the terminals for the purposes of a handy lamp for pottering about the workshop on the dark winter nights in the country, where gas is not available. If you can name a better combination I shall be glad to hear of it.—J.M.L.

A dry cell would light a test lamp quite well for short periods. If, on the other hand, you wish to use it for any length of time, an accumulator would be better.

A Loss of Compression.

?

I have a 1908 Triumph motor bicycle, of which the compression is very poor. I have fitted new piston rings, ground in the valves, and tested the joints of the valve caps with oil. Could you suggest anything to improve the compression? Do you think the cylinder is scored? If so, how can I put it right again?—J.W.C.

Probably, after the piston rings have been run in for a short time the compression will return. You seem to have done everything possible, and we can only suggest that you make certain that there is a clearance between the valve stems and tappet rods. After several grinding operations the valve stems are lengthened, and sometimes prevented from closing owing to there being no space between valve and tappet. If the above is in order, take the machine to a competent repairer to find out if the cylinder has been scored.

Changing the Type of Carburetter.

?

Kindly advise regarding my M.M.C. engine, 80 by 80 mm. I have used a surface carburetter, but have recently fitted a Longuemare spray carburetter, Model H, fitted with 8 spray and choke tube about $\frac{7}{8}$ in. inside diameter. I cannot get the motor to run even on stand. I have tried smaller choke tubes, altered the height of petrol in float chamber, varied the size of air holes under spray, but with no good results. Occasionally there are a few explosions, yet the motor and silencer seem to have any amount of petrol flying about them. The same petrol will fire in surface carburetter. Do you think the carburetter is too large for engine?—W.H.

Probably in coupling up the carburetter to your machine there is a leakage of air at the union. See that the joints are tight, and, if necessary, fit a fibre washer where you suspect any leakage. If air is drawn into the engine through a faulty joint it will stop a spray carburetter from acting altogether. Are you sure that the petrol is coming through the spray satisfactorily? You can test this by pressing the float chamber button sharply, when a fine spray of petrol should shoot out from each slot of the jet. We think that the carburetter is quite the right size for the engine, and expect that it will give good results after a little perseverance. If you cannot improve matters consult a local repairer.

Misfiring at Slow Speeds and Plug Points Too Close.

?

My 1908 Triumph will not run slowly when throttled down, but misfires. The carburetter is clear, and the engine fires quite well at a speed of fifteen miles an hour, but on closing the throttle and shutting off the extra air misfires. I have not put in the air cone, as I took it out for summer riding. I have just cleaned the magneto and the contact points and condenser terminals. I also have fitted a new fibre ring, and the points break rather far apart—about 3-16ths of an inch. The rocking arm is very slightly worn where it touches the fibre ring. The chain driving the magneto is at a good tension. Would it be any good to fit a paper washer beneath the platinum tip on the rocking arm to bring the points closer together? Can you explain why on bringing the plug points

The illustration shows a 9 h.p. Advance Tricar belonging to a very aged lady, who finds it more convenient than a carriage, because the seat is so near the ground. She, with an equally aged companion, occupies the front seat, while a professional chauffeur drives them. The machine is geared so as not to exceed the legal limit, and has a rigid rear frame with sprung bucket seat.

very close together the engine should misfire at low speeds? A short time ago I was overhauling my engine which had been running well, and finding the plug points rather far apart closed them in. The engine fired well at high speeds, but refused to go without misfiring at anything under 20 m.p.h. I tried everything I knew to cure the fault, and eventually widened the sparking plug gaps, when it ran all right again. When I first had my engine it ran well on the throttle down to 6 m.p.h. without altering the magneto advance, but cannot get it to do that now. Why I don't know.—N.H.W.

Obviously, if you take out the air adapter you cannot run at slow speeds. As far as we can gather your magneto is perfectly satisfactory, although the amount of break seems excessive, but we should not recommend you to alter it until you have tried the engine with the air adapter replaced. We cannot understand why bringing the plug points very close together should cause the engine to misfire at slow speeds, unless, of course, they become shorted by particles of carbon. The makers of your magneto recommend the plug points to be .4 mm. apart.

Building Up a Motor Bicycle.

?

For some time past I have been looking for a motor bicycle that would exactly suit my requirements, and not having found one yet I have been thinking that perhaps I might be able to build one on my own lines, buying the parts separately and putting them together myself. Would there be any special knowledge wanted in doing this? Of course, I should like to be able to assemble it myself, but if you think this would be difficult for one who has not touched that sort of work before, I could have it built by an engineer.—C.E.H.

A certain amount of special knowledge would be required in building up a motor bicycle, and unless you have had considerable experience with motor cycle building and engineering we should not advise you to attempt to build your own machine. Far better

place the order with an experienced local assembler. If you like to send us a specification of the machine you propose to have built for you we will give you our opinion on it.

If "An Interested Reader," Christiania, will send us his correct name and address, and enclose a stamped and addressed envelope, we shall be happy to reply to his letter. We should also like to point out that unless correspondents in the British Isles accompany their queries by a stamped and addressed envelope they are liable to be overlooked.

THE NEW PENNY EDITION OF "THE AUTOCAR."

Readers of "The Motor Cycle" who are interested in motor cars are reminded of the new Penny Edition of "The Autocar," now obtainable of all Newsagents and Booksellers every Friday Morning.

Early delivery of orders placed during December.

A. W. Wall Ltd.
Roc Motor Cycle Works
Birmingham

160 VARIATIONS OF GEAR RATIO

are obtained with the

"GRADUA" GEAR

Do you realise what this means?

12 variations between $3\frac{1}{2}$ and 4 to 1, i.e., $3\frac{1}{2}$, $3\frac{1}{3}$, $3\frac{1}{4}$, $3\frac{1}{5}$, $3\frac{1}{6}$, $3\frac{1}{7}$, $3\frac{1}{8}$, $3\frac{1}{9}$, $3\frac{1}{10}$, $3\frac{1}{11}$, $3\frac{1}{12}$, 4.
24 variations between 4 to 1 and 5 to 1, i.e., $4\frac{1}{4}$, $4\frac{1}{5}$, $4\frac{1}{6}$, $4\frac{1}{7}$, $4\frac{1}{8}$, $4\frac{1}{9}$, $4\frac{1}{10}$, $4\frac{1}{11}$, $4\frac{1}{12}$, $4\frac{1}{13}$, $4\frac{1}{14}$, $4\frac{1}{15}$, etc., etc.
24 variations between 5 to 1 and 6 to 1, i.e., $5\frac{1}{5}$, $5\frac{1}{6}$, $5\frac{1}{7}$, $5\frac{1}{8}$, $5\frac{1}{9}$, $5\frac{1}{10}$, etc., etc., etc., etc., etc., etc.
24 variations between 6 to 1 and 7 to 1: 24 variations between 7 and 8 to 1:
24 variations between 8 and 9 to 1: 24 variations between 9 and 10 to 1.

ALSO FREE ENGINE.

ONE HUNDRED AND SIXTY VARIATIONS BETWEEN $3\frac{1}{2}$ to 1 AND FREE ENGINE.

A turn of a small wheel—that's all. No pedalling. No sudden jamming in.

The "Gradua" gear is the most important invention ever brought out in connection with motor cycling. As the pneumatic tyre is superior to the old solid, so is the "Gradua" gear to any other contrivance.

An adjustment is provided for tightening the belt, which reduces the necessity of shortening it.

The "Gradua" gear is fitted to our "Zenith" (rigid frame, spring forks,) motor bicycle, also to the well-known "Zenette" (double-scissors) spring frame bicycle. It has had twelve months' thorough test before being offered to the motor cycling public, and has splendidly acquitted itself in every competition in which it has been entered, such as Land's End to John-o'-Groat's; London to Plymouth and back; A.C.U. Penalty Run; A.C.U. Quarterly Trials, etc., etc., and in various Hill Climbs—Sutton Bank; Cudham; Lippetts Hill; Newnham Hill, etc., etc.

To prevent needless correspondence we may say that we are NOT disposed to undertake conversions of other machines.

TRIAL RUNS BY APPOINTMENT ONLY.

ZENITH MOTORS, [LTD., (Showrooms) 119, STROUD GREEN ROAD, FINSBURY PARK.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or sent to London (20, Tudor Street, E.C.), on the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.
York and Lancashire.

SECTION III.
Derby, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.
Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.
Gloucester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.
Bristol, Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.
Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.
Devon, Dorset, and Cornwall.

SECTION X.

SECTION XI.
Ireland and Isle of Man.

1909 TRIUMPHS.

PROMPT DELIVERY OF A LIMITED NUMBER FROM STOCK.

DEFERRED PAYMENTS.
EXCHANGES.

SHOP-SOILED and SECOND-HAND SINGLE CYLINDERS.

TRIUMPH, 1908 (October,) with costly extras and spares, as new	£47 10
TRIUMPH, 1908, Palmer back tyre and other extras accessories, perfect	£35 0
TRIUMPH, 1908, very good order	£32 0
TRIUMPH, 1907, delivered June 1908, new cylinder and piston, overhauled	£28 0
TRIUMPH, 1906, magneto, perfect order	£23 0
TRIUMPH, 1905, accumulator, no faults	£18 0
ROC, 1908, two-speed, magneto, 4 h.p.	£33 0
N.S.U., 1908, magneto, 3½ h.p., shop-soiled, £50 machine	£30 0
N.S.U., 1907, spring forks, Roc two-speed gear	£28 0
VINDEC two-speed, 1907, magneto, perfect ..	£26 0
ROC, 1907, magneto, clutch, spring forks ...	£19 0
WARWICK, 1908, shop-soiled, two-speed, clutch, magneto, spring forks, £50 machine ..	£31 0
SINGER, 3 h.p., magneto, belt drive, Mabon clutch, perfect order	£15 0
ASTER, spring forks, Longuemare carburettor, tyres sound, good order	£9 0
WHITLEY, 3 h.p., spray, carburettor, girder forks	£5 10
B.S.A., M.M.C. engine, 3½ h.p., Druid forks, Lomax band, grand condition	£11 0
WERNER, good appearance and running order ..	£3 0

TWINS.

N.S.U., 1908, magneto, 4 h.p., shop-soiled, £50 machine	£39 0
BROWN, 1908, shop-soiled, 5½ h.p., two-speed, Palmer tyres, cost over £67	£45 0
ROC TWIN, 5 h.p., magneto, clutch, show model, done 300 miles, perfect	£30 0

PREMIER TUBULAR STANDS, 7/6.
Approval.

WRITE FOR LISTS OF ACCESSORIES.
We have a limited number of Shop-soiled and Second-hand PREMIER Lamps, Stands and Carriers, etc., at Clearance Prices. List free.

PREMIER MOTOR CO., LTD.
Aston Road, BIRMINGHAM.
Telephone 4,370. Telegrams: "Primus, B'ham."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

IMPORTANT NOTICE.

Owing to the
CHRISTMAS HOLIDAYS

Advertisements for the issue of 23rd inst. must reach Coventry not later than first post on Thursday, 17th Dec., and for the issue of 30th inst. not later than Wednesday, Dec. 23rd.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

N.S.U. 6 h.p. Twin, new condition, two-speed gear, spring forks, magneto, 24 by 2½ tyres, also new Chater-Lea coach-built sidecar for same: any trial given: the lot £29. no offers.—7, Railway Terrace, North Shields.

SECTION II.

York and Lancashire.

5 h.p. Twin Rex, fitted new pistons, cylinders, valves, etc.; £13 10s.—Max Woods, Rock Villa, Latchford.

1908 Triumph, splendid condition, complete, headlight, horn, tools; £36.—Cross, jeweller, Rotherham.

3 h.p. Fafnir, cylinder, piston, valves, etc., grand order; cash offers, or exchange.—Judson, 142, Belgrave Road, Oldham.

TRIUMPHS and N.S.U.'s, 1909 models; early deliveries; any make supplied.—Mold-green Engineering Works, Huddersfield.

TRIUMPH, 1908, brand new; £44; complete, accessories; 1909 models now in stock.—Hitchings, Ltd., 74, Bold Street, Liverpool.

2½ h.p., Inclined Minerva Engine, new tyre, Whittle belt and spares, good condition; £10.—Box 1,338, The Motor Cycle Offices, Coventry.

7 h.p. Peugeot, Druids, Jap carburettor, very low, spares, guaranteed perfect; cheap.—Hall, 26, Oxford Road, Waterloo, Liverpool.

As the largest dealers in Rex motor cycles, we can offer the remaining stock of brand new 1908 2½, 3½, and 5 h.p. Rexas at prices to "lick creation." Wire offers. Luke Sharp.—Halifax Motor Exchange, Westgate, Halifax.

In answering any of these advertisements it is desirable that you mention "The Motor Cycle."

MOTOR BICYCLES FOR SALE.

The Ideal Car

FOR THE
MAN OF MODERATE MEANS.

Have you tried the P. and M. Two-speed Motor Cycle with castor wheel sidecar? It is as easy to drive and as safe and comfortable as a car; but the cost of upkeep is quite another story. There is no necessity to rush hills. The P. and M. can be driven at a crawl, or will romp up if desired. The sidecar is easily and quickly detached, enabling the machine to be used for solo work, and saves storage room.

THE NEW P. & M.—Handle starting, handle-bar control, magneto ignition, two-speed gear.

Price £52 10s., or complete with sidecar, £65.

Trial runs by appointment. Early deliveries arranged.

Owing to our foresight in placing our contracts early we are in a position to accept orders for delivery to suit your own convenience for—

1909 TRIUMPHS.

CONSIDER COMFORT CONSCIENTIOUSLY.

CONSULT

Eric S. Myers,

and derive comfort from the fact that you are buying from an active and experienced "motor cyclist," comfort in knowing that your requirements are in the hands of a "live" agent.

PRACTICAL KNOWLEDGE IS HITCHED ON TO THE "NO WORRY DEPOT" AT

BRADFORD,

where you may see and buy the wonderful

1909 TRIUMPHS

which are as usual "years ahead"

"PEUGEOT"

2½ and 3½ h.p. SINGLE CYLINDER

3½, 5, and 7 h.p. TWIN CYLINDER

ENGINES.

Specify a PEUGEOT Engine to be fitted to your motor bicycle, and refuse all IMITATIONS.

Full particulars, with list of GENUINE SPARE PARTS, and a P.P.C. of Tourist Trophy winner, on application.

J. TAYLOR, 318, Percy Road, BIRMINGHAM.

ADVERTISERS — Please note that Friday is the latest day we can receive advertisement copy for the following week's issue.

MISCELLANEOUS.

CASH, credit, or exchanges entertained. What offers? One Kerry motor cycle, 3½ h.p., spring fork, handle-bar control, new 20 amp accumulator, good lamp, and horn, ready for the road.

ONE Humber Motor Cycle, 1½ h.p., direct chain drive, a splendid lightweight, thoroughly reliable.

ONE Coach-built Trailer, slightly soiled, splendid condition; £1 10s. buys it.

ONE Bosch Magneto, new, shop-soiled.

ACCUMULATORS, new.—Twelve, 10 amp. 4 volt; twelve, 20 amp. 4 volt; twelve, 40 amp. 4 volt; bargain prices; don't miss one.—W. Harris, Lee, 152, Bolton Road, Bradford.

FLEXIBLE as a chain, strong as steel, lin. belts; 12s. 6d.—Venn, Lawley Street, Birmingham.

USE K. Brand Oils and start easily; testing sample free.—Kelly and Company, Bridge End, Leeds.

2 h.p. F.N., Rich's tubes, adjustable pulley, girder forks; £12, bargain.—Cross, Ham, Old Windsor.

SMART Whipcord Motor Cycling Breeches; 8s. 6d.; post free; patterns.—Meredith's, Wearwell, Northwich.

NEW 35s. tricar headlight, 15s.; 70 mm. cylinder head, 5s. 6d.; 24in. Chater wheel, tyre, tube, forks, 11s., perfect.—8, Crieff Road, Wandsworth.

WHAT Offers?—Eisemann's magneto and coil, for single-cylinder motor; also Clincher tyre and tube, 26 by 2½, new cona- tion.—Pickles, 10, Lambton Street, Hull.

BARGAINS in Cars and Tyres.—4½ h.p. two-seated De Dion, good running order, with wind screen; £16.

10-12 h.p. Belsize, two-cylinder, seats four, good running order, tyres, etc., good; £27.

TWO Covers, 700 by 85, 10s. each; good selec- tion of other sizes very cheap; 18 tubes, various, 880 by 120, 920 by 120, 875 by 135, 815 by 105, 910 by 90, 10s. each, good second-hand; also Whitworth screw-cutting lathe, 8ft. bed, £17, weight about 1 ton; and a quantity of 3 and 4-jaw lathe chucks, cheap.—Carey's, Elephant Road, London, S.E. Phone, 2052 Central.

KENT Two-speed Gear, foot clutch, motor cycle frame, tank, and 26 by 2½ back wheel, all complete; £4 18s., genuine bargain.—George, 47, Montague Road, Dalston, Lon- don.

3 h.p. Fafnir, special racing engine, will do 50, No. 6 frame, enamelled dark green, Chater spring forks, Brooks saddle, Clin- chers, and Continental tyres, both new, cop- per torpedo oil and petrol tank, footrests, two 20 amp. C.A.V. accumulators, Matchless foot brake, inlet and exhaust valves, usual tools and spares, machine three months old, guaranteed in perfect condition, plating and enamel as new; price £20.

RIGID Sidecar, 26 by 2½in. Michelin tyre, upholstered wickerwork; 35s.

23 h.p. Fleet, Minerva engine, complete with 24 Minerva carburetter, perfect, used very little; £4.

NO. 6 Pattern Frame, less front forks; 15s.

SOLID Drawn Brass Torpedo Petrol Tank, to fit No. 6 frame; 12s. 6d.

THREE 28 by 2in. Beaded Edge Covers, two second-hand, one quite new; the lot £1.

NEW Python Brass Motor Horn, with flex- ible tube and bulb, deep note; 18s. 6d.

CARRIAGE paid on any of above on re- ceipt of P.O., to Motor Works, Liphook, Hants.

STAND Carrier, 3s. 6d.; large treble-twist horn and tube, 8s. 6d.; car mirror, 2s. 9d.; large brass tail lamp, 7s. 6d.; car coil, perfect, 7s.; Phare Ducellier headlight, 35s.; approval.—Sydney, 34, Bedford Square, Lon- don.

TANKS, torpedo and ordinary, from 5s.; long handle-bars, 4s.; swan-neck saddle pillars, 2s. 6d.; frames from 50s.; all repairs and alterations; please note, business transferred to larger premises.—Arrow Motor Works, 83, Rye Lane, Peckham.

MISCELLANEOUS.

£2 10s., or offer.—Osborne four-speed gear late pattern, had little wear, good condition.—B. E. Sutton, Eaton Bray, Dunstable.

DON'T Scrap that cracked cylinder. Try Barker's iron cement; stands great heat; 1s. tin saves pounds.—Oxford Road, Worthing.

LOW Frame, wheels, tyres, 70s.; M.M.C. cylinder, 100 by 100, patched water-jacket perfect, 25s.; flywheel, 5s.; coil, 5s.—8, Princes Street, Swindon.

TWO Dunlop Covers, brand new, 26 by 2, beaded, 16s. 6d. each; new heavy charging dynamo, 120 watts, 38s. 6d. — 8, Southchurch Lane, Bishop Auckland.

MOTOR Cycle Frame and forks, brass petrol and oil tank, £3 5s.; Bowden band brake, 15s.; separate generator lamp, 10s. 6d.—Thwaites, 4, High Street, Stoke Newington.

HANDLE-BAR Controls, brand new, with two cables, 3ft. 6in. long, best make and finished nickel plate; 5s. 6d. each; easily fitted; approval.—22, Hall Street, Southport.

X RAY Outfit, complete; will take £25, or exchange for 1908 Triumph or Rex lightweight motor cycle, cash adjustment either way.—Dr. Hirst, Birchfield House, Gildersome, near Leeds.

EXTRA Heavy Clincher, 15s., tubes, 4s.; F.R.S. 15s., generator 12s. 6d.; Continental belt, 10s., 3in., 90; two-speed clutch, £3 10s.; Lucas guinea horn, 10s.; offers approval.—Lomax, University, Birmingham.

GRIPWELL Motor Cycle Brakes, to fit any make machine, delivered from stock; price 15s. 6d.; any spare parts supplied.—Sole manufacturer, W. Cocks, The Durham Motor Works, opposite station, South Ealing, W.

F.R.S. Lamp, new, and large generator, 25s.; 10 amp. P. and R. accumulator, charged twice, 10s.; three 3in. belts, 15s.; syren, 6s.; fur cap, new, 15s.; toolbag, 2s. 6d.; leather suit, 10s.—Grove House, Whyte-leafe.

MOTOR Overcoat, latest cut, waterproof, wool lined, suit man 5ft. 6in., or taller, 9s.; leather jacket, almost new, 6s.; three new Lanco mica plugs, 2s. 6d.; Express voltmeter, new, 5s.—76, Kerbey Street, Bromley, London.

CAPE Hoods, direct from the manufacturers, from £3 10s.; wind screens from £2 10s.; sample material and measurement forms on application; best house in the trade.—Universal Motor Co., 37, Chestergate Stockport.

MOTOR Cyclist's Double Breasted Fleece Jacket, £1; leather waistcoat, 15s.; chamois leather pants, 8s.; the lot for £2, cost £4 5s.; little worn, excellent condition.—King, Walton House, Surbiton Road, Kingston-on-Thames.

THREE Speeds, free engine pulleys, £2 5s.; adjustable and free engine pulleys, £1 15s.; free engine pulleys, £1 5s.; adjustable pulleys, 10s.; all guaranteed, 1909 models.—New Nonpareil Motor Fittings, Ashtree Road, Starchley, Birmingham.

TERMINALS made of heavy gauge copper, high and low tension; no need to run nut or screw right out to make connection; self-locking; no lock nuts or screws; send 7d. P.O. for one dozen assorted.—Rouse Bros. and Coles, 576, Streatham High Road, S.W.

ORMONDE Frame, with tank, 15s.; front wheel, 28 by 2, good Dunlop tyre, 10s. 6d.; 3in. belt rim, 1s.; 3in. pulley, 1s. 6d.; 25 amp. C.A.V., good, 8s. 6d.; exchange small accumulator, spring forks, stand, lamp.—Motors, Polvernock, Sanguhar.

CLINCHER 26in. by 24in. Covers, ribbed, practically unused, 15s.; lens projector lamp, with generator, new, 17s. 6d.; Frankonia, complete, new, 10s.; Dermatine 3in. belt, 7ft. 6in., new, 7s. 6d.—No. 1,336, The Motor Cycle Offices, Coventry.

760 by 90 Cover, retreaded with Moseley non-skid, not used since, £3; ditto plain tread, £2 10s.; tubes 15s. each; 810 by 90 grooved Dunlop, good, 25s.; ditto tube, 15s.; leather coat, 15s.; charging battery, four-cell, 10s. 6d.; Harvey-Frost model A. workshop vulcaniser, perfect, £5; 12 h.p. side entrance car, tyres new, five-seated, perfect, hood Stepney, will accept tri-car or small car part.—Dagley, Kempston, Beds.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

Interesting Accessories at the Paris Salon.

AMONG the numerous accessories exhibited at the Paris Salon was the Fixator locking washer, which also serves for locking the position of control levers at any point desired, yet leaving them quite free when it is the desire of the operator to move them. The principle upon which the Fixator acts will be best understood by reference to the line sketch (fig. 1). The coil spring A is a fairly tight fit on the shaft B, and, the two ends A_1 and A_2 being bent at right angles, it will be noticed that if pressure is brought to bear at the ends in the direction of the arrows SS_1 it will be impossible to turn the coil, because such pressure only tends to further tighten the coil on to the shaft. If pressure is brought to bear in the contrary direction, *i.e.*, in the direction of the arrows VV_1 , the tendency of such pressure is to expand the coil, when, of course, it can be moved without the slightest effort. In adapting the device for locking nuts the extremity of the coil B (fig. 3) has a right angle claw or stud, which is fixed in a hole bored in the part on which the nut is to press. This permits the nut to be turned in the direction of screwing up, but if one attempts to unscrew it the contraction of the coil offers considerable resistance—in fact, it is almost impossible to turn back the nut with ordinary means, as the harder one tries to turn it the tighter the coil grasps the plain portion of the nut around which it fits. If it becomes necessary to unscrew the nut all that is required is a slight application of force to the extremity A in the opposite direction to the

way in which the nut tightens, when it can be removed without difficulty. We think it is in its application to levers that it will meet with most consideration from motor cyclists, and, we understand, it is the intention of the makers, the British Fixator, Ltd., 73, Moor-gate Street, E.C., to market shortly a handle-bar control with two levers for operating the air and throttle openings of motor cycle carburetters.

Another small accessory which will interest motor cyclists is the Vulcan vulcaniser. This was exhibited by J. Lacoste et Cie., and consists of a very small vulcanising apparatus, which, it is claimed, will vulcanise perfectly the air tube or cover of a motor cycle or motor car. The chief claim in connection with it is that the heat is automatically governed, and that it requires no thermometer and no regulation of the means of producing heat. The heating lamp is contained in the cylindrical portion A, and when this is taken out it is filled with alcohol until it overflows. The cost of alcohol for each operation, it is said, does not exceed one-tenth of a penny. After the lamp is filled it is returned to its place. The door B is then

LUBRICATION.

By VICTOR W. PAGE, M.E.

It was with interest that I perused "Ixion's" comment on lubrication which appeared in *The Motor Cycle* of September 16th, and I agree with the opinions expressed in every particular. It is true that some form of automatic oil feed would be superior to the present inefficient, hit or miss hand force pump system of oil injection as commonly fitted to machines all over the world.

I have been advocating improvements in lubrication systems for several years, and have been in communication with the manufacturers of the various makes of motor cycles which I have owned from time to time, but all that I get for my pains is that any system of oiling other than the simple one provided will introduce an element of complication which is undesirable, the object being to simplify the motor cycle, and not add to the mechanism.

This is the same argument that has been advanced in this country (America) against the adoption of the magneto or the two-speed gears, which are considered almost as essential as the motor in England. As a general thing, the roads of the U.S.A. are not good, and the country is rolling, especially in New England. While there are many miles of excellent highways built

tion to ride with certainty or safety. In spite of this fact, but little consideration is given to the two-speed gear, which I regard as absolutely necessary. Imagine the pleasures (?) of operating a 3 h.p. tricar without either free engine clutch or change-speed gear through three or four inches of sand. Our American makers do not favour the two-speed gear—it "increases complication"—and have the same attitude in respect to fitting an improved system of lubrication.

I give in this article a few sketches made by me and used in a communication in a recent issue of a prominent American motoring paper (the *New England Automobile Journal*), which illustrate the subject under discussion, and I hope will interest your readers who are concerned in the improvement of the modern motor cycle. There is nothing radical about either of the proposed improvements, these being essentially the same as used by prominent makers of motor cars, and I do not see that there will be any great increase in complication by their use. There has been no attempt to preserve proper proportion, the drawings being merely to illustrate principles involved.

The Lubrication Problem.

There is no condition more important than continued and efficient lubrication in obtaining continued service from any piece of mechanism, and the internal combustion motor is no exception to the rule, especially those of the type used for motor cycle propulsion. These engines are for the most part air-cooled, and as the temperatures of operation and speed are high, proper lubrication is imperative. The method in use in the majority of cases is by splash, and this has much to commend it, being simple, cheap, and easily applied. In some motors the level is maintained by constant drip feed direct to the crank case, in others a hand force pump is used to force the lubricant from the container into the engine base. Too much oil is as bad as not enough, and a practical lubrication system must not only be automatic, but supply the lubricant in the proper quantities for various speeds at which the engine is run. The splash system as commonly fitted does not do this, and as a result many cases of imperfect operation or defective motors can be traced directly to neglect of oil supply.

The Splash System.

The splash system is illustrated in fig. 1, the position of the oil tank and force pump being identically the same as on the most popular of American motor cycles, the Indian. The oil in the crank case is maintained at such a level that the revolving parts dip into the lubricant, which is supplied to the parts needing it in the form of a spray or mist. If the level is properly maintained, the entire internal mechanism will be positively lubricated, but there is no absolute certainty of this being done. The judgment of the operator is the only criterion, and if he be an expert the chances are in favour of proper lubrication. If a novice, too much or too little oil may be supplied, and as a result the cylinder will be either flooded or starved, and neither condition is conducive to efficient power output.

One cannot blame the novice for not supplying oil properly, as manufacturers' instructions are rather

FIG. 1.—Simple Splash System of Lubrication.

under supervision of the various state governments, the country roads are in most cases dirt, sand, or gravel with a loose surface, which demands careful manipula-

Lubrication.—

vague in this respect, generally being expressed as "give it a pumpful every eight, ten, or twelve miles." Absolutely no mention is made that this is entirely dependent upon the speed of operation, and not always upon the distance the motor runs. Under some conditions, such as racing at top speed, it might be necessary to oil the motor every four or five miles; under other conditions, replenishing the supply oftener than every fifteen or eighteen miles would be a waste of good oil.

One good feature of the Indian system is the provision of a sight-gauge glass to indicate the oil level, but as this cannot be seen without dismounting, and as it is seldom marked to designate the proper height, oil is supplied in most cases without consulting it at all.

Level Maintained by Pump.

Fig. 2 illustrates the general principles of a system which has recently become very popular among manufacturers of motor cars, inasmuch as it is a self-contained method of lubrication which ensures the automatic maintenance of proper level. In this the oil is maintained at a proper height by means of a pump, which constantly supplies fresh lubricant to the case, the surplus being allowed to drain back into the container, which is integral with the base, through an overflow. Before passing into the pump, the oil is filtered and all particles of foreign matter removed, and because of this the oil may be used over and over again for some time, thus ensuring positive lubrication as long as the proper attention is paid to the amount of lubricant in the tank.

With regard to increased complication, the only apparatus required in addition to the oil tank is the filter and pump, the latter being of the gear type and driven positively by the engine. As the pump is used to promote circulation of none but clean oil, there will be but little wear evidenced during the life of the mechanism. The filter is arranged so that it can be easily removed for cleaning, and a drain cock or plug is provided, so that the oil may be drained from the system periodically and fresh lubricant supplied. The body of the gear pump could be well incorporated in the crank case casting, cast integral, and the mechanism could be driven by direct gear connection from the camshaft or crankshaft. The gears could be enclosed, as are the timing gears, and but little power would be consumed in driving the pump.

Advantages Outlined.

The advantages of such a system as they appear to the writer are: (1) Positive lubrication with but little attention; (2) the level would be maintained regardless of engine speed; (3) economical use of lubrication would be assured; (4) the supply of oil would be adjusted when the engine was built; (5) it would remain in proper adjustment indefinitely; (6) the lubricant would not be affected by conditions of temperature or climate; (7) the same grade of oil could be used the entire year; and (8) the system would be automatic in action and could not be tampered with by the inexpert.

While slightly more complicated than the simple system shown in fig. 1, and more costly to install, the important advantages enumerated should outweigh other considerations, as the use of such a system on a motor cycle would be a refinement of detail which would

be greatly appreciated by the purchaser. Such a method will remove many of the objections which have been advanced against the splash system of lubrication and one filling of oil would run several hundred miles without further attention.

A Direct Feed System.

The writer has always favoured a direct supply of oil to the points needing it, and the elimination of all splash if possible, especially on an air-cooled engine, where the slightest surplus of lubricant will cause a smoky exhaust. The splash systems have disadvantages which must be taken into consideration.

If the engine was to be operated always on the level and over smooth roads, the constant level splash system would be ideal, as there would be absolutely no variation of level at any time, but in practice the

| E. Oil level. | |

level is always fluctuating. Various road conditions and gradients will change the location of the pool, and, while lubrication is assured as long as there is any oil to speak of in the case, on the other hand there is danger of too much being distributed. If there is much movement of the oil, greater quantities will be picked up than is necessary.

lubrication.—

With multiple cylinder motors, especially those of the tandem form, with cylinders in line with the frame, as is the case in motor car construction, and on the F.N. (Belgian) and Pierce (American) motor cycles, where four cylinders are used, the effect is more marked. The writer does not mean to imply that the splash system is not good or that proper lubrication is not obtained when this form of oiling is used, as many designers are apparently well satisfied with the results obtained. The writer has yet to see a motor where the splash system is used which will not at times cause the exhaust to smoke, and in which the lubricant does not get past the piston rings into the combustion chamber, where it will assist in forming undesirable carbon deposits.

In order to eliminate the disadvantages which are inherent with the simple method previously outlined, the writer suggests another method of lubrication, as shown in fig. 3. A double plunger pump is placed on or incorporated with the motor base, the plungers of which could be actuated by any suitable mechanical means; as illustrated, movement is obtained by a small crank and connecting rod driven from the main or camshaft.

Each of these pumps is fitted with two check valves—one inlet check and one outlet check. In fact, they are the same in construction as those commonly used and operated by hand, except that they are much smaller and the plungers are solid. Tight joints can be ensured by the use of miniature stuffing or packing boxes at the top end of the barrel or cylinder.

One of these is used to pump oil from the tank carried at the side of the motor cylinder to the header or manifold fastened to the side of the container, from which one lead goes to the cylinder and one to each main bearing. The other pump takes the oil from the sump below the crank case, passing it through a filter into the main tank, from which it is used again.

A sight feed is used in the system at the header, so that the operator can determine at any time whether the pumps are performing their proper functions or not. The arrangement of piping is plainly marked in illustration, and the oil flows into the sump at the bottom of the case by gravity.

The piston is cast integral with a large oil groove, this registering with the hole through which the oil is forced into the cylinder. A hollow gudgeon pin is employed, through which the oil flows and lubricates the gudgeon pin bushing. After this the oil flows down into the crank case by gravity, and the lower connecting rod bearing is kept properly lubricated by the oil which passes down a copper pipe placed alongside the connecting rod, and which provides a passage from the gudgeon pin to the lower crank pin box. As is obvious, there will be a constant oil mist present while the engine is in operation, and ample lubrication is assured. A four-lead header may be used, the extra lead supplying the timing gears and valve operating mechanism. The same type of pump as shown in fig. 2 may be used with success. The piping may be of comparatively large diameter in either system to minimise danger of stoppage, though this is not likely if one considers the filtering screen which will prevent particles of foreign matter passing.

While this system involves more complication than either of the others previously mentioned, the fact that

more positive lubrication is obtained must be the strong argument in its favour. It is true that this system would be the costliest of all to install, but on further consideration, is not the best the cheapest in the end? Why is the magneto increasing in favour, superseding coil and battery ignition, though costing three times as much? Why the free engine clutch and two-speed gear? Surely a motor cycle will run without them? A mixing valve can be used in place of a float feed carburetter at less cost. Why not use the mixing valve?

It is because it is recognised that the factor of first cost is not the only consideration, but that freedom from trouble, continued operation, and efficient power output are fully as important with discriminating riders.

Advantages of Direct Feed System.

The cost of installing the system presented above would not be high, especially if incorporated in the manufacturer's original design, and suitable provision made for fitting the parts. The small double plunger

FIG. 3.—Mechanical Force Feed System.

| H. Return to tank. | Q. Connecting link. |

pump used is not costly, neither is the filter, header, nor piping required. The container is necessary no matter what system is used. The pumps working constantly in lubricant would have long life, and best of all, the supply of oil to the cylinder and bearings would be directly proportionate to the speed of the engine.

Lubrication,—

The feed of oil would start with the engine and stop automatically when the engine stopped. No adjustments are necessary, circulation is positive and rapid, and clean oil is used at all times. One filling of the tank should last several hundred miles, and the system is entirely self-contained. It appears to the writer that such a system is a refinement of detail which can well be incorporated in future motor cycles, as there is nothing radical or experimental in the design, and that it will provide positive lubrication is incontrovertible.

This is the solution of the lubrication problem which best appeals to the writer, and it may be adapted to any number of cylinders merely by increasing the capacity of the pumps and adding more leads or feeds to the manifold or header.

Good luck and long life to "Ixion," and may he long continue to give his frank opinions of the various appliances and incidents which are part of motor cycling. I agree with him in most particulars. Though the average reader may consider us as cranks, what care we! Having had our say, we may rest satisfied.

A TYPICAL FRENCH TRICAR.

TO be the only tricar to survive the ordeal of the 1908 Tour de France organised by the Auto Cycle Club de France without penalisation was somewhat of a feather in the cap of the constructor, M. René Bérudeau, and he is justly proud of the achievement of the little machine which he drove himself. Considering the very small facilities he has for building tricars and motor bicycles, M. Bérudeau has every right to be proud of the honour which he earned with his machine, especially as he had as competitors machines constructed in larger and better equipped workshops, and under far more favourable circumstances.

The Bérudeau tricar is a compact little machine, and has several good points. Asked whether he could supply us with drawings of the machine, M. Bérudeau remarked that he had not troubled to make designs, nor had he had time to get out detailed drawings, but he and his assistant had built the machine up with the aid of a few written points as to design. It will be noticed that it is very low built; as a matter of fact, the clearance between the bottom of the crank case and the ground is only four inches. There is only the same clearance under the front seat.

Details of the Tricar.

The chassis is of tubular steel of about $1\frac{1}{2}$ in. diameter, consisting of two side members extending from the axle of the rear wheel to the front of the springs of the forecarriage. The chassis acts as the support of the forecarriage, carries the springs of the front axle, and also bears the weight of the engine. The steering pillar is very strong and rigid, and it will be noticed that the handle-bars are of just sufficient length to make the steering of the machine comfortable.

The engine fitted is a $4\frac{1}{2}$ h.p. De Dion of 84 mm. bore and 90 mm. stroke. This type of engine was chosen because it is considered to be the most flexible engine on the French market, and, having very little vibration, it is the most suitable for tricars. Ignition is by dry batteries, but, of course, magneto can be fitted if desired. The engine is water-cooled on the thermo-syphon system, the radiator being of the vertical copper tube type without gills. This type of radiator, it might be mentioned, is most popular in France; firstly, because it can be made and fitted by any manufacturer without having to pay or obtain any patent rights, and, secondly, because it has been found sufficiently efficient for its purpose. The quantity of

water carried is about 14 litres (roughly, $3\frac{3}{4}$ gallons). The ampleness of the radiating surface can be easily gauged when it is remarked that there are 104 tubes in the radiator, each of about 9 in. in length.

On the engine-shaft is fitted a Bozier two-speed gear, the controlling lever being on the left-hand side of the tank. The drive to the rear wheel is by means of a Hans Renold chain, which the designer thinks cannot be beaten for wear. For keeping his chain in good condition M. Bérudeau has fitted a little arrangement

The only tricar to survive the 1908 Tour de France. It was not exhibited at the Salon.

of his own with which he is rather pleased. In the photograph will be noticed a little torpedo-shaped tank placed near the saddle, and connected with this tank is a rubber tube, the unconnected end of which is allowed to hang just over the chain. Oil is carried in the tank and is allowed to drip on to the chain, so that a constant supply of lubricating oil can be given to the chain when the tricar is running. [It would appear that Frenchmen care little for being bespattered with oil.—ED.]

Leather lined band brakes are fitted to the rear wheel, these being operated by a pedal on the left-hand side. Ordinary 26 in. wire wheels are fitted, having Dunlop tyres, and the overall length of the machine is about 9 ft.

The petrol tank is made to carry 14 litres, and $2\frac{1}{2}$ litres of oil are provided for. It is claimed for this machine that it will travel 100 kilometres (62 miles) on $5\frac{1}{2}$ litres (just under $1\frac{1}{2}$ gallons) of petrol, and 1 litre (slightly over a quart) of lubricating oil.

The Hirst Magneto.

ANOTHER excellently finished motor cycle magneto which is new to our readers is the Hirst. This is a compact machine measuring $4\frac{1}{2}$ in. high and weighing 6 lbs. with the double magnets. One of the best points about this magneto is the substantial contact breaker. In the attempt to reduce the size and weight of motor cycle magnetos one or two manufacturers have reduced the size of the contact breaker proportionately, but this is not desirable. The contact breaker is practically the only part of a magneto susceptible to wear, and consequently adjustments are from time to time necessary. Naturally the more minute the proportions of the contact breaker the more quickly it will wear, and, moreover, the more difficult it becomes to effect adjustments. In the Hirst magneto the contact breaker parts are of substantial proportions, and should last for a considerable mileage without signs of wear. The insulated contact screw A is adjustable to take up wear on the fibre ring (fixed inside the timing lever J) and platinum points C. The end of the bell crank D is not in contact with the fibre ring for the whole of its circumference, but merely strikes the projecting piece each time the armature is in the "maximum" position. This is the flat spring actuating the bell crank. The condenser M is very neat, and mounted at the back of the contact breaker, and naturally rotates with it. The contact breaker cannot be replaced in a wrong position, as a pin E on the brass recess fits into a corresponding hole in the support K for the insulated screw. It is held in place by a centre screw. The working of the magneto can be noted when the outside

plate F (held by the spring) is removed. The armature can be inspected readily by taking off the cover G, held by spring clips. The Hirst magneto has plain bearings, the ends of the armature-shaft being of phosphor bronze, revolving in hardened steel bearings—the reverse to the usual order of things. The

Another new motor cycle magneto—the Hirst. The letters are referred to in the accompanying text.

claim for this is that steel does not wear so rapidly, and the bronze shaft will wear equally all round, and not in one place, as is the case when a bush is held stationary. An oil channel is cut in the bearings, but no wicks are provided, so that frequent lubrication will, we imagine, be necessary, owing to the high speed at which a motor cycle armature revolves. The terminal H over the top of the contact breaker is for attaching the handle-bar switch wire. The magnets and pole pieces are mounted upon an aluminium base, and the usual method of attachment by bolts is adopted.

A NEW SPRING HANDLE-BAR.

A SPRING handle-bar for motor cycles is the subject of a recent patent by S. Allen and Co., 8, Elswick Court, Northumberland Street, Newcastle-on-Tyne. The makers claim that the spring handle-bar is superior to a spring fork, as the latter absorbs road shocks directly, allowing the engine vibration to be communicated to the hands of the rider, whereas a good spring handle-bar absorbs all vibration, whether from road or engine. The hinge or working part of the Ideal spring handle-bar shown in the accompanying drawings is fitted with ball bearings, and cannot wear loose. The design does not interfere with the working of the front brakes, owing to the particular angle at which the mechanism has been designed. This renders it applicable to almost any

existing motor cycle, no matter what kind of brakes are used.

The spring can be readily adjusted to any tension by screwing or unscrewing the plug at base of inclined socket.

We are fitting one of these handle-bars to a light tricar, and will let our readers know our opinion of it in due course.

OCCASIONAL COMMENTS.

By "IXION."

Front Stands.

It was in response to an appeal of mine that the first front wheel stand for a motor bicycle was produced, and I feel a pardonable pride in reminding my readers that several patterns were on view at the Agricultural Hall, and so anyone who has felt the need of such a fitment has only got to send in his order. Needless to say, I have not a farthing's interest in any of them.

Accessories.

It was good to see practically every machine fitted with a stand-carrier and tool and luggage bags specially designed for it. The average motor bicycle is designed to look pretty, and its unfortunate purchaser has usually been compelled in the past to tie various unsuitable impedimenta all over it, till it has looked like a newly stocked gipsy caravan.

Things we Overlook.

The steady march towards perfection includes the detail which visitors to an exhibition commonly overlook. To mention a few, I saw the following articles in a far more perfect form than the best samples I have inspected at previous shows: Lamps, generators, non-skids, inner tubes, tool kits, bags of all sorts and sizes, tools, belts, hooters, hooter clips, brakes, oil-cans, belt fasteners, sparking plugs, valves, handle-bars, tanks, magnetos, coils, accumulators, silencers, clothing, gloves, waterproofs, variable gears, number plates, etc.

Pocket Tool Kits.

My note about pocket tool kits has borne fruit. I find some motor cyclists prefer not to open up their main kit for every minor adjustment, and therefore carry half a dozen smaller tools loose in their pockets, to the great detriment thereof. The majority of the pocket kits marketed are faulty in one of two respects. Either they contain too many tools, and are so bulky as to spoil the hang of a coat, or else they fail to include several of the tools we motor cyclists require most frequently. Our catalogue of minor adjustments comprises the magneto, carburetter, sparking plugs, contact-breaker, and belt. Our ideal kit must therefore include a 4in. wrench, contact file, knife, belt punch, carburetter jet broach with holder, borers, and tiny pliers. I am glad to announce that two firms intend to market such a kit shortly.

Transmission Development.

I often appear as rather a bold prophet, but I have some courage in predicting that the belt will eventually disappear from the machine de luxe. These machines are now so skidless, so well protected from mud, and so powerful that it is as easy to make a double century run on them over bad roads as formerly it was over favourable surfaces; but over and over again one is baulked by the belt. The leather belt retains a *queue* of faithful followers as a dry weather transmission, but we all prefer rubber when it rains. Even the rubber belts, however, are none too reliable when grit and dirt are showered on to the belt and pulleys, and if a pulley be worn out of truth further progress may become absolutely impossible when the weather

is really bad. Therefore the standardisation of an entirely weatherproof transmission is probably only a matter of time, and I should not be at all surprised to see the higher-priced machines, as a class, fitted with a spring worm drive and a disc clutch before many more years have passed. I shall, however, demand that one safeguard be fitted in such a drive, namely that in the event of either drive or engine suddenly jamming provision shall be made to prevent locking of the rear wheel, with its inevitable consequence of a nasty spill.

A 1909 A.O.I.V.

At the recent show I examined a 1909 type of automatic inlet valve—an improvement so admirable and simple that why we did not have it years ago is one of those things which "no feller can understand." The old cotter, slotted stem, and plain bored sliding cap are for ever discarded. The stalk of the mushroom valve has no slot or keyway, and is screw-threaded for its top ½ in. or so. The cap is internally screw-threaded, and may be set at any height on the thread of the stalk, being fixed by a lock-nut. This method of construction produces five great advantages in practice:

1. Stalk, being solid, is far less likely to break.
2. There is no cotter to come adrift.
3. Amount of "lift" or "opening" can be instantaneously adjusted without calling for a fresh cotter, etc.
4. Alteration of correct opening by wear is negligible.
5. Weak springs can be easily stiffened.

Every alteration usually carries in its train the possibility of one or more entirely new troubles, and scanning this new valve with an ultra-critical eye we can easily see that if the lock-nut came adrift and fell into the cylinder matters would be slightly more serious than if a cotter or split pin became detached. But if the lock-nut is thoroughly tightened, this will be highly improbable, and it could also be safeguarded by the employment of a split pin, which would not weaken the stalk half as much as a big cotter does; or, again, the tip of the stalk could be lightly riveted over, as the direction of adjustment is almost certain to be towards the head of the valve, which would not entail the removal of the nut.

At the Paris Salon. A Rene-Gillett Twin-cylinder Air-cooled Tricar with front springing. The transmission is by a flat belt.

THE WEAR ON MOTOR CYCLE CYLINDERS.

ONE hears various statements made from time to time regarding the amount of wear that takes place on cylinders and pistons of motor cycle engines. One of the favourite contentions concerning cylinders is that they wear oval, and that the top wears more than the bottom. There is no doubt that the last-named allegation is a true one, but when the amount of wear is so small as to be almost negligible we think it is worth recording. Some cylinders wear much quicker than others, and we think it will generally be found that large cylinders wear quicker than small ones. Whether this is due to the lubrication not being quite so effective in the case of large cylinders or not, we will not attempt to prove. The fact remains that cylinders of very high speed engines with small dimensions wear much longer than larger and slower running ones, without reboring. As an instance of the almost infinitesimal amount of wear in the cylinders of a four-cylinder F.N., we print below a letter from an Associate Member of the Institute of Automobile Engineers, who has measured the cylinders of his F.N. four-cylinder after running the engine approximately 132 millions of revolutions, which with a gear of six to one and a road wheel of 26in. diameter equals a distance of over 5,000 miles:

TABLE GIVING THE SIZE OF BORE IN MILLIMETRES OF THE FOUR CYLINDERS OF A F.N. MOTOR CYCLE ENGINE AFTER MAKING APPROXIMATELY 132,000,000 REVOLUTIONS.

		No. 1 Cylinder.	No. 2 Cylinder.	No. 3 Cylinder.	No. 4 Cylinder.
Measurements on cylinders parallel to crankshaft	1	45.034	45.034	45.022	45.018
	2	45.072	45.072	45.034	45.021
	3	45.085	45.123	45.060	45.034
	4	45.136	45.161	45.072	45.047
Measurements at right angles to above	1	45.009	45.034	45.034	45.009
	2	45.060	45.072	45.022	45.047
	3	45.060	45.136	45.072	45.047
	4	45.034	45.136	45.060	45.060

NOTE.—No. 1 measurement is taken at the mouth of the cylinder, No. 2 at ¼ in. stroke up, No. 3 at ½ in. stroke up, and No. 4 at the top. The above measurements are guaranteed accurate to the second place of decimals.

J. H. LOUGHBOROUGH, A.M.I.A.E.

A PETROL TANK AIR REGULATOR.

MOTOR cyclists are aware how difficult it is to prevent petrol splashing out of the air vent in the filler cap of the tank when the latter is full. If the cap is bored with a small hole in the side or centre the petrol is usually jerked out when the tank is full, and unless there is a hole in the cap the tank becomes air bound, and the petrol will not flow freely to the carburetter. Mr. James Baxter has introduced a little device which should overcome this difficulty. Reference to the accompanying sectional sketch shows that the hole in the regulator is covered at the top by a steel ball. When the machine is

A. Glass top.
B. Filler cap.
C. Leather washer.
D. Air holes.

ridden the steel ball is shaken from its seating, and air is allowed to enter the tank. When the machine is at rest the ball covers the hole and prevents the petrol from becoming stale. If there is any tendency for the petrol to squirt out the lower ball is lifted by the petrol and held against the bottom seating of the regulator, so preventing the spirit from coming through. With this air regulator in use the petrol tank can be filled to the brim. To fit it to a filler cap a 3/8 in. hole must be bored in the cap, the regulator passed through, and the nut screwed up from underneath, a leather washer being fitted between the two as shown.

A NEW VALVE SPRING ATTACHMENT.

AN ingenious device for simplifying the removal of mechanically operated valves has been submitted to us by the patentee, Mr. C. Newman, 48, Sylvester Street, Sheffield. The accompanying line

FIG. 1. FIG. 2.
A. Exhaust or inlet valve.
B. Bottom half of case.
C. Top half of case
D. Valve spring.
E. Studs.
F. Milled nut.
H. Set screw.
J. Valve cotter

illustration is a sectional drawing of a valve with the device fitted to it. To remove the valve the engine is turned until the valve rests on its seating, then with a screwdriver or other tool the spring is pushed back in the case, and the milled nut screwed up until it compresses the spring sufficiently to allow the cotter in the valve stem to be removed with the fingers only. To replace the valve it is inserted in the usual way through the centre of the spring and case, and when down on its seating the cotter is inserted in the stem and the valve slightly lifted, releasing the strain on the milled nut, which can be screwed back to its former position. A small grub screw is inserted through the milled nut and between the sides of one of the slots in the outer case; this prevents the milled nut from turning round through vibration or any other cause. The milled nut can also be used for slightly altering the tension of the spring if desired. Fig. 1 shows the case drilled with holes at the top and bottom for the circulation of air in the case of a very hot engine.

If any readers are at a loss to know what to select as a Christmas gift for their friends who own and ride a motor cycle, we cannot suggest a better way out of the difficulty than that they should send at once to Messrs. J. B. Brooks and Co., Ltd., Great Charles Street, Birmingham, for particulars of the many equipment specialities which they manufacture. Any one of these would be keenly appreciated, and the many forms of touring bags will, without doubt, form most appropriate gifts. Brooks's bags can be inspected at any of the leading motor cycle depots or agencies.

VINDEC SPECIAL

THE MOTOR CYCLE OF MERIT.

FOR THE SPEED MERCHANT.

7 h.p. Brooklands Racer.

The above is simply an illustration of our standard Model G Light Tourist with mudguards, stand, carrier, and toolbag removed and adjustable handle-bar lowered, and shows how the machine can be stripped down and adjusted for track racing. It can be supplied either with 5 h.p. or 7 h.p. twin-cylinder engine.

FOR THE TOURIST.

Model F. 5 h.p. or 7 h.p.

Our standard Touring Model with Truffault suspension forks and full touring equipment. An ideal machine for those who want solid comfort combined with reliability and speed.

"Vindec" Riders are Satisfied Riders.

Let us send you the Booklet which illustrates and describes our 1909 Models.

The next issue of *The Motor Cycle*, which will be dated December 23rd, will contain special and seasonable articles and illustrations.

Motor Cycles and Undergraduates.

A valued correspondent informs us that the rumours and extracts from the new regulations affecting the use of motors by Cambridge undergraduates, which have been published by the daily papers, have caused unnecessary alarm, as they were in the majority of cases inaccurate. Motor cycles are included in the new regulations, but at present the conditions are not for publication.

Ten Miles Limit at Newhaven.

Success has attended the opposition of the Motor Union to the application of the Newhaven Council for an eight mile speed limit on so much of the main road from Brighton to Eastbourne within the urban district of Newhaven as extends from its junction with Lewes Road to its junction with the road leading to the Harbour, on the east side of the railway crossing. The Union asked that the speed should be ten miles instead of eight, and called evidence that it would be unreasonable to expect motor cyclists to travel up the hill leading to Lewes Road at the lower speed. The Local Government Board has adopted the Union's view and refused to make the eight mile limit applied for and granted one of ten. The matter is of importance to motorists touring along the South Coast or crossing to the Continent by the Newhaven-Dieppe route. The restriction comes into force at the beginning of next week.

Imports of Motor Cycles.

While the Board of Trade returns for the eleven months ended 30th November show a falling off in the imports of foreign made motor cycles, the exports of British machines show a considerable increase.

During November thirty-five motor cycles valued at £907 were imported, as against ninety-six (value £2,824) in 1907, and fifty-eight (value £1,826) in 1906. Adding the value of the parts imported the figures for November stand as follows:

1906.	1907.	1908.
£5,414	£4,637	£2,703
The total imports of foreign motor cycles and parts during the eleven months ended 30th November were:		
1906.	1907.	1908.
£76,833	£76,075	£60,709

Exports of British Motor Cycles.

Turning to the exports, 168 complete motor cycles of the value of £6,192 were exported last month, compared with seventy-one (value £2,446) in November, 1907, and eighty-seven (value £2,537) in the same month of 1906. The total November exports were: 1906, £4,755; 1907, £4,072; 1908, £7,449. The British exports during the eleven months ended 30th November were:

Value of complete motor cycles—		
1906.	1907.	1908.
£21,973	£25,186	£33,768
Parts thereof—		
1906.	1907.	1908.
£26,474	£24,461	£18,336
£48,447	£49,647	£52,104

Touring in Germany.

A Bristol member of the Motor Union complains of the tax imposed on a motor bicycle and sidecar during his tour in Germany. Both among Germans and tourists this taxation arouses criticism, and it has engaged the attention of the Ligue Internationale des Associations Touristes, of which the Motor Union is a member. The increased taxation now being levied for Budget purposes renders remote the likelihood of the removal of this tax, consequently still fewer motor cyclists will make Germany a touring ground.

The Hour Record at Brooklands.

Mr. C. R. Collier writes: "I think it only fair to myself that your readers should be acquainted with the details regarding the alteration of the distance of my recent hour record, for on reading your editorial note on same in the last issue, one would imagine that this alteration was due to a wilful breach of rules on my part. On this occasion, before I was given the word 'to go,' I was particularly warned by the official time-keeper of the A.C.U., and also by the secretary himself, to ride outside the 50ft. line, which I was most careful to do, the reason being given that the track was measured from this line. However, I now read in the press that my record has not been passed because a rule of the Union states that I should have ridden on the 10ft. line, which rule, by the way, I had never before heard of, and apparently the secretary also was unaware that any such rule existed. I consider such ruling on the part of the Competitions Committee of the A.C.U. is not only grossly unfair to myself, but must certainly appear very strange to continental motor cyclists who held this record previous to my attempt on October 8th."

Unrolled Stones.

The A.C.U. secretary, 18, Down Street, Piccadilly, W., writes: "With reference to the letter from 'Cedniv-5' in your last issue on the above subject, if he will kindly communicate with me, giving particulars of where such patches of stones are to be found, I will gladly take the matter up with the County or Borough District Council. There is no obligation upon a local authority to place a warning light, but some councils, when the danger of unrolled stones has been pointed out to them, have kindly had warning lights placed there until the stones have been rolled in."

FUTURE EVENTS.

- Dec. 16—Motor Union General Committee Meeting.

Re-exports of Foreign Machines.

Last month's re-exports were valued at £1,487, as compared with £1,079 in November, 1907, and £418 in November, 1906. During the eleven complete months of 1908 £12,363 worth of motor cycles and parts have been re-exported from this country, £6,060 worth during 1907, and £4,586 worth in 1906.

A Quick Action Repair Pedal.

An American advertisement of a "quick action repair pedal," which will be sent free to any dealer who sends his letter heading to the advertiser reads strangely to English motor cyclists. The quick action repair pedal appears from an illustration in an American journal to be a bar of steel corrugated in the centre and screwed at each end to attach it either to the right or left crank. The bar is intended to be carried in the toolbag. American pedals must be very liable to breakage or the machines to side-slipping to cause anyone to market the "quick action repair pedal."

V 369.

The N.S.U. Motor Co., Ltd., of 186, Great Portland Street, W., would be pleased if the owner of the 3 h.p. motor cycle, accumulator ignition, with plates bearing the above numbers and letters, could communicate with them.

General Meeting of Motor Cyclists.

We direct readers' attention to letter No. 3726 in this issue, signed H. B. Jenner. In this letter the hon. sec. of the South Eastern Auto Cycle Association suggests a monster meet of motor cyclists near to London, and appeals to clubs to elect representatives to arrange details with him. We think that such a meeting would be productive of much good, and shall be happy to give publicity to the movement from time to time.

Motor Cycles at the Paris Salon.

As would be gathered from our descriptive article published on the 9th inst., fewer motor cycles were shown at this year's Paris Salon (which closed on Sunday last) than in 1906 and 1907. Below we give the number of machines shown in 1906-7-8 for comparison:

	1906	1907	1908
Firms showing motor cycles	31	45	46
Number of motor cycles	79	98	108
Motor bicycles with fore-cars	2	5	4
Motor bicycles with trailers	1	—	—

A Singular Application.

At the South-western Police Court on Friday last, Ebenezer Burt, trading as a cycle dealer, Upper Tooting Road, was summoned for detaining a bicycle belonging to Mr. Herbert Edward Ward, a solicitor, two motor engines, etc., the property of Guy Harrell, of Boyd Road, Merton, and a trailer, the owner of which is Alfred James Munday, residing at "Russellton," Upper Mitcham. Mr. Ward, one of the complainants, supported the summons, and Mr. Hanne defended. The defendant did not put in an appearance, and his absence was made more strange by contradictory statements regarding his whereabouts. A man came forward to state that the defendant was ill. This individual, who seemed very uncertain in his answers,

had been commissioned, it was suggested, by a sister of the defendant to offer this explanation. The woman was ordered to stand forward, and when asked where the defendant was said, "In London." Mr. De Grey (severely): "What address in London? Speak the truth." The woman was subsequently forced to admit that the defendant was away on business and could not attend. Mr. De Grey said she was trying to mislead the court, and directed her to stand down. As regards the bicycle, the evidence did not justify the magistrate making an order, and the summons in respect of this was dismissed. The motor engines were, according to the evidence, placed in the defendant's care, he having agreed to purchase them at 55s. He paid 5s. on account, and offered to send on the balance. This

THE JARROTT CUP.

The handsome cup illustrated was presented to S. G. Frost at the annual dinner of the M.C.C. on Saturday. The trophy was won on a 4½ h.p. Minerva Motor Bicycle in the London to Land's End and Back Run (555 miles) on August 3rd and 4th. The presentation was made by Mrs. Chas. Jarrott.

he failed to do; the owner could neither get back his property nor the money. The defendant was interviewed, when he said, "Cash sale be hanged; the goods are here on sale and exchange, and I can bundle the lot back if I like." Mr. Munday said he entrusted the trailer to the defendant's care. He (witness) had asked for it back six or seven times. Mr. De Grey ordered the return of the things in the last two cases, or the value.

Latest Police Traps.

Readers are advised of the following measured stretches of road:

London - Cheltenham Road. Trap working from Witney to one mile out towards Minster Lovell.

Mortlake District. Flashlight trap working in the East Sheen Road.

Wimbledon. Trap working between Windmill Road and Wimbledon Village.

Bath Road. At Burnham, about midway between Slough and Maidenhead, for exceeding the speed limit.

At Twyford.

Folkestone Road. Between Lee Green and Eltham, working Friday to Monday inclusive at present. One starting point is at the Avenue, Eltham Road.

Mr. Cove's Paper.

A paper, "Motor Cycles at the Stanley Show," was read by Mr. H. G. Cove before members and friends of the Essex M.C. on Thursday, in the comfortable Hertfordshire room of the Great Eastern Hotel, Liverpool Street, and was attended by a large number of motor cyclists. The author was somewhat critical, but though his criticisms were severe they were made in the right spirit, namely, with a view to bringing the motor cycle nearer to perfection. Mr. B. R. Chatterton was in the chair, and introduced the lecturer. All the machines mentioned by the lecturer were fully described and illustrated in our special show numbers. Three of the complete machines—the James, the Humber, and the Light weight twin-cylinder L.M.C.—were by no means spared by the lecturer in his criticisms, who criticised those points in which he thought there was room for improvement. A summary of the discussion will be published next week.

CLUB NEWS.

Cambridge University M.C.C.

The committee of the C.U.M.C.C. hope that all members of the University who are interested in motor cycling will join the above club. Full particulars can be had from A. H. Moreing, hon. sec., Trinity College.

Coventry M.C.

This club's fifth annual dinner will be held on Saturday, January 23rd, at the Craven Arms Hotel, Coventry, at 6.30 p.m. The prizes won during 1908 will be distributed, and it is hoped that every prize winner will be present to receive his award.

Sheffield and Hallamshire M.C.C.

The above club has decided to affiliate to the Motor Union instead of the A.C.U. The hon. secretary, Mr. T. F. Turner, writes: "I may say that the A.C.U. themselves are wholly to blame for this change: First, because of the way our club was boycotted at the general meeting at the beginning of the year; also, that it is our firm opinion that they do not want provincial clubs, for if they did they would certainly give us more benefits than they have done."

Hull and East Riding A.C.C.

Thursday, December 17th, is to be a ladies' night at the Grosvenor Hotel. Display of lantern slides by the hon. secretary and a good musical programme. Tickets, 1s. each or 1s. 6d. double, can be obtained of members or the hon. secretary. All motor cyclists in the city are invited.

Perth and District M.C.C.

On Thursday last, the 10th inst., Mr. James W. Robertson delivered a lecture in the St. John's Hotel, John Street, on "Motor Cycles for 1909." The lecture was illustrated by a series of lantern slides made from photographs furnished by the Editor of *The Motor Cycle*. A goodly number of members were present, and as each machine was in turn described by Mr. Robertson, there was a general discussion on it. In the absence of the president (Mr. A. T. Paterson), the Vice-president (Mr. T. D. Frew) thanked Mr. James W. Robertson for his lecture, which everyone had enjoyed, and alluded to the immense amount of labour involved in making so many slides. Mr. W. J. Sommerville then proposed a vote of thanks to the Editor of *The Motor Cycle* for so

Club News.—

kindly lending the photographs. Mr. W. Batchelor afterwards proposed a vote of thanks to Mr. Grieve for his assistance at the lantern, which concluded a most enjoyable evening.

Newcastle-under-Lyme M.C.C.

It was decided, at a meeting of motor cyclists in Newcastle (Staffs.) and district, to form a club to protect the interests of its members and organise competitions. It is proposed to affiliate to the Auto Cycle Union. The hon. secretary of the club is J. H. Higson, Northcote Place, Newcastle, Staffs.

Southern M.C.

At a committee meeting held on the 10th inst. it was decided to call the annual general meeting for January 21st. Tickets for the annual dinner will soon be available. It will be held at the Holborn Restaurant on February 4th. Members are requested to keep this date open. The Triumph medal for the single-cylinder motor cycle class in the last hill-climb has been awarded to Mr. J. H. Wheeler (3½ h.p. Triumph). The committee have decided to hold a social evening at the club headquarters every Thursday commencing at 8.30.

Middlesbrough and District M.C.C.

There was a brilliant assembly in the Victoria Hall, Middlesbrough, on Friday night, on the occasion of the annual ball of the Middlesbrough Club. The elaborate decorations in the hall, corridors, and supper room had been carried out by Messrs. J. R. Storry and Sons. Mrs. Ball's catering was most satisfactory, and Mr. J. Burns's band provided an excellent programme of music. There were over 100 couples present, and Messrs. J. Dale, E. Downing, and G. Sanderson ably fulfilled the duties of M.C.'s, and with Mr. S. Gjertson's assistance as hon. secretary were largely responsible for the unqualified success of the gathering.

Southend and District M.C.

By order of the committee, the hon. secretary has lodged with the Local Government Board an objection to the Southend Borough Council application for a ten-mile speed limit in certain streets of the borough of Southend-on-Sea, as being unnecessary for the safety of the public. The date of the inquiry has not yet been fixed.

The committee has decided to give to the members next year a copy free weekly of *The Autocar* if they are car members and of *The Motor Cycle* if they are motor cyclists.

The following gentlemen have recently been elected members: Messrs. A. G. Welch, Percy J. Garon, and Lewis Utton.

The hon. secretary, Mr. A. Warnery, will not, after the annual general meeting of the club, which it is proposed to hold in the latter part of January next, be able to continue the duties of secretary, but it is very gratifying both to the committee and the secretary to report that Mr. H. Greenfield, captain of the club, has been induced to take over the position, if elected. Mr. Greenfield has been a strong supporter of the club, practically from its inception, and the club's interests should be well safeguarded in his hands.

Harrogate and District M.C.C.

The subject of a discussion on the 4th inst. was "Ideas and Improvements at the Stanley Show." Mr. T. Atkinson read an interesting paper on the principal recent alterations. What struck Mr. Atkinson most was the number of new firms entering into competition with the older concerns. He considered that this proved the growing popularity of motor cycling. In the lecturer's opinion most of the improvements and alterations were confined to details, and some of the machines had nearly reached perfection. He said he would very much like to see the cylinders altered. In his opinion the majority of cylinders were made too light for the work they were called upon to do, and he thought that if the makers put more metal into the cylinders we should hear much less of wear of cylinders. It was not real honest wear, but wear caused by warping of the cylinder walls, and this was caused simply by the cylinders being made too light for their work.

Mr. H. Fortune gave a short description of the present-day lightweight. He considered that a machine with an efficient engine of 2½ h.p., with magneto ignition, spring forks, and pedals, was all that was required, provided, of course, the rider was content to travel at the legal limit, and to assist his little steed up exceptional hills. The weight of the

machine should not exceed 100 lbs., including tools, lamp, and horn.

Mr. Berry stated that he possessed a 1½ h.p. motor bicycle, and the way this little engine could work was really wonderful, and he was only called upon to assist with pedals on big hills.

The next gathering will take place early in the New Year, and will take the form of a whist drive.

Walthamstow M.C.

This club held its second annual dinner, followed by a Bohemian concert and the distribution of prizes at the City Arms, St. Mary Axe, E.C., on the 5th inst. Mr. R. J. Holt presided, and was supported by a large muster of members and friends. Many ladies were present. The dinner was followed by a well-arranged programme, which everybody enjoyed. The toasts were as follows: "The King, Queen, and Royal Family," proposed by the Chairman; "The Club," proposed by the Chairman, response by J. W. Percival, hon. sec., who reported the satisfactory progress of the club during the year; "Ladies, Visitors, and Artistes," proposed by Mr. A. H. White, and responded to by Mr. A. J. Jackson on behalf of the visitors; and "Chairman and Vice-chairman," proposed by Mr. W. H. Applebee. The musical programme was much appreciated by the company.

During the interval the prizes were graciously presented by Miss Bazzone to the winners of the 1908 competitions.

During the evening a presentation of a massive marble clock was made on behalf of the club by Mr. W. H. Applebee to Mr. J. W. Percival for his services as hon. sec. of the club. Mr. Percival made a suitable acknowledgment.

Sunderland and District M.C.C.

The annual smoking concert was held at the Grand Hotel, Sunderland, on Wednesday, the 9th inst. Major E. Vaux, D.S.O. (president), occupied the chair for the first part of the evening, and presented the prizes won during the past season, and Captain Maurice Moore was chairman later. Among those present were Mr. W. Dunn (captain of the Newcastle M.C.) and several other members of the Newcastle organisation; Mr. Hodgkin (hon. sec. of the North-eastern Automobile Association), and a detachment of the Territorial Cycle Corps.

Major Vaux urged every local motor cyclist to join the club and become affiliated with the R.A.C. and A.C.U.

Captain Moore endorsed these opinions, and also invited the members to assist the Territorial Cycle Corps in connection with the military manœuvres, and thus do their duty to the country and prove the usefulness and reliability of the motor cycle.

Mr. Fred Turvey offered a challenge shield to the club for competition, which he suggested should take the form of a reliability trial and surprise hill-climb.

Mr. Dunn referred to the good feeling existing between the Newcastle and Sunderland clubs, which he hoped would continue.

The Sunderland M.C.C. now numbers about 45 members.

Mr. Russell Jackson proposed "The Visitors," and Mr. Dunn responded. A pleasant musical programme was contributed during the evening.

ALLEGED BREACH OF CONTRACT.

Holdsworth Bros. v. Hodgson was an action for alleged breach of contract heard at the Halifax County Court on the 1st inst. The amount claimed was £18 10s. The plaintiffs are proprietors of the Halifax Motor Exchange Co., carrying on business at 16, Westgate, Halifax, and the defendant a monumentalist, of Kirkby Stephen. Mr. Charles Clarkson represented the plaintiffs, and Mr. Wm. Rees, of Kirkby Stephen, was for the defendant. The plaintiffs advertised a 3½ h.p. motor cycle, and the defendant entered into correspondence and agreed to exchange a 4 h.p. tricar, and certain other goods for the motor cycle. T. Holdsworth, a member of the firm, in cross-examination, said that he could sell the cycle at present at £17 10s. The defence was that the original contract had been broken, and without calling the defendant his Honour dismissed the claim with costs.—*The Halifax Courier*.

THE NEW PENNY EDITION OF "THE AUTOCAR."

Readers of "The Motor Cycle" who are interested in motor cars are reminded of the new Penny Edition of "The Autocar," now obtainable of all Newsagents and Booksellers every Friday Morning.

Along the Normandy Coast.

[3727.]-Mr. W. H. Thompson, in his interesting article entitled "Along the Normandy Coast," states that the A.C.U. agents' *mécanicien* sent him on the wrong road to Honfleur. Possibly the redoubtable Gustave, who is not given to sending people on the wrong road, mistook the author's pronunciation of Honfleur for Harfleur. The obvious way to reach the former town from Havre is not by road at all, but by one of the small steamers which make the journey daily.

MOTOCYCLETTE.

Silence, Footrests, and Brakes.

[3728.]-Having visited the Stanley Show, and having seen the many important improvements which have been made both in general and in detail design, it seems to me that finality is not even approached, as "Ixion" suggests, either as regards motor bicycles in general, or any of the distinct types into which they may be sub-divided. Three important points strike me as deserving more attention both from designers and critics.

The first is silence. There was a most remarkable contrast between the Stanley and Olympia Shows. At the former few makers laid claim to peculiar silence, and improvements in silencers were few and far between. At the latter almost every maker made a most emphatic claim for very quiet running, and the many remarkable improvements were by no means confined to silencing the exhaust. It is superfluous to point out that, whether motor cyclists want silent machines or not, the public, with their horses and dogs, strongly object to noisy ones, and the notion is still very prevalent that every explosion of a single-cylinder engine communicates a fearful thud to the rider.

The second is the position of footrests. Now that nearly all machines are fortunately built so low that a man of average height can sit on the saddle and comfortably place both feet on the ground, it seems obvious that the footrests should be as low down as is consistent with safety in order to secure the greatest advantage as regards both comfort and stability. Yet the prevailing practice is to place the footrests above the magneto transmission, the Phelon and Moore and Rex machines being notable exceptions.

The third is brakes. Of the two types of pedal applied belt rim brake, the one in which the pull is applied below the pivot of the shoe is still in the minority. Its advantages seemed obvious, even without experience, but having used both types under all conditions, I am surprised that the triumph type has not become universal. "Ixion" in his comments has lauded the pedal applied belt rim brake, but as not, as far as I can remember, ever distinguished between the two types.

LN 5065.

The Future of the Tricar.

[3729.]-I can quite endorse what you say as to your specification of an ideal tricar. I have been driving a similar one to your design, except that it is water-cooled, with tank low down near handle-bar; 2½ in. front tyres, 2½ in. back, and I have had no trouble with them. I have no two-speed gear, and there is not a hill I have failed to get up with a nine stone passenger. I have been up 1 in 12 with twelve stones, gear 6 to 1, although when I first had motor cycle I could not do so. It is a knack in driving.

I have a large silencer 18 in. by 5 in., and can only hear the tapping of the valves. I have accumulator ignition—two accumulators and trembler coil in a box on the footboards. The limit of power for tricars should be 5 h.p., air or water-cooled, belt driven, with two speeds. If you exceed 5 h.p. you only have increased weight, heavy gears, chains, and back-built seats. The heavy type of tricar is a car on three wheels, and can you expect one wheel to stand the strain of two? That is the cause of half the trouble.

Why try to save the small extra license duty and pay six times the amount in tyres alone? If you exceed 5 h.p. you must have four wheels. And why "open" frame when you can get more rigidity with a closed one? What does it matter if the tank is between your knees? You can have heel steering, a bucket seat, and much wider footboards. If we want more we must have a car.

I will not trespass further on your invaluable space, but makers will only build a tricar on the lines you have specified (3½ h.p. and 5 h.p.) they would find a ready sale. There are thousands of people who do not care for motor bicycles, and have never ridden a push bicycle, so cannot

ride, but would buy a light smart and safe tricar. It is most enjoyable to take one's wife, sister, or cousin for a ride. Then again, nearly all motor bicyclists are single men. It is the married man of moderate means who wants the ideal tricar. He does not want a motor bicycle. He does not, in all cases, like a sidecar. He wants a light motor cycle to carry two.

J.B.N.

A Veteran Motor Cyclist.

[3730.]-I send you a photograph of myself and my machine. I am only a young rider, who has just learnt to ride a motor cycle at the age of sixty-two. It is never too

late to learn. I look forward to your Wednesday's issue with relish. It was a good number last week. I have bought "Hints and Tips"; they are very good.

J. CLAYTON.

Magneto Manufacture.

[3731.]-Having read the letter from the Bosch Magneto Co. on the above subject, and the reply given by the Premier Accumulator Co., Ltd., in *The Motor Cycle*, I have a Bosch magneto on my machine, and I have nothing but praise for its reliability, accuracy, and freedom from troubles, etc.

Oh, excellent Bosch magneto, thou hast attained a height of dazzling eminence, so have other magnetos, English and foreign, so has one made by a lad in a back bedroom of his own home; and, if that is so, where does the "special plant," "special tools," and "special materials" from all parts of the world come in, as suggested by the Bosch Co., as the primary essentials?

This lad lives close to Preston. He is 18½ years old, serving his apprenticeship at a large electrical engineering works. He has made a magneto in his special workshop, and his special plant is an old sewing machine, utilised as a kind of winding arrangement, and his special tools are those he uses every day in his daily work. He takes all the turning and lathe work that is required to his shop, and his special materials were bought in Preston, which is only a small dot on the map of England. He only gets 1½d. out of every shilling he earns for spending money, so he cannot roam so far in the world in search of specialities. As for special tools, you would not expect anyone to chase a thread on the end of the armature shaft with a writing pen nib, any more than you would expect a man to carve a chicken with a bicycle pump, yet both instruments are absolutely essential for the purposes for which they are intended.

Oh, Bosch magneto, thou hast been flung from thy lofty pinnacle by a home-spun magneto, which, for simplicity and easy getatableness, is a marvel.

"A Machine for Sidecar work."

*Extract from article, "The Motor Cycle,"
Dec. 9th, 1908.*

....And then, glad day! I purchased a Roc motor bicycle, with Roc two-speed gear and free engine clutch, and it did not take long for me to discover I had got a good thing. No sudden dismounts in traffic! Instead just take the high speed gear out of action with one touch of pedal—bring machine to rest.... then with road clear—gradually press pedal and off again without the usual shove to start and leap into the saddle.

I have yet to find a hill the Roc with sidecar won't surmount on the low gear. I would like to answer two objections to the Roc which makes me wonder if they are at all inspired.

(1.) Handle starting. I find no difficulty.

(2.) Slipping of brake bands. I have not experienced this even on steep hills with a weight of 7 cwt.

I have no interest in machine or sidecar other than that of a well-satisfied owner.

(Hundreds of original letters in similar strain are in our possession.)

THE HOME
OF THE

ZENITH

THE MOTOR CYCLE WHICH HAS
MADE FINSBURY PARK FAMOUS,

will immediately after Christmas be removed to Weybridge, Surrey (30 minutes rail from Waterloo). Commodious works and showrooms have been secured (at 1, Church Street, Weybridge) a few minutes from Brooklands Track.

A few more trial runs can be given at Finsbury Park by appointment only.

To prevent disappointment, orders for machines for early 1909 delivery must be placed immediately.

The "Zenith Bicar" spring-frame motor bicycle, open frame and forkless, **43** guineas nett. It starts with a handle, same way as a car. Absolute safety, as side-slip almost impossible.

The "Zenette" or double-scissors spring-frame motor bicycle, **39** guineas nett. Or fitted with the Gradua variable gear—160 variations between 3½ to 1 and 10 to 1—a turn of a small wheel, that's all—**50** guineas nett.

The "Zenith-Gradua," rigid frame model, with spring forks and Gradua gear, **50** guineas nett. A distinctive pattern; low position of rider, long wheelbase.

The "Zenith" Tricar, spring-frame, 6 h.p. twin-cylinder J.A.P. engine, chain drive, 3-speed gear, **72** guineas. A marvel of value!

"Zenette" Tricar-de-luxe, 6 h.p. twin-cylinder J.A.P. engine, water-cooled, finest coach-built body, open frame, bucket seat, wheel steering, **90** guineas. The handsomest Tricar on the road. Spring frame. Most luxurious in every respect.

ZENITH MOTORS, LD., 119, Stroud Green Road, Finsbury Park, LONDON.

In answering either of these advertisements it is desirable that you mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

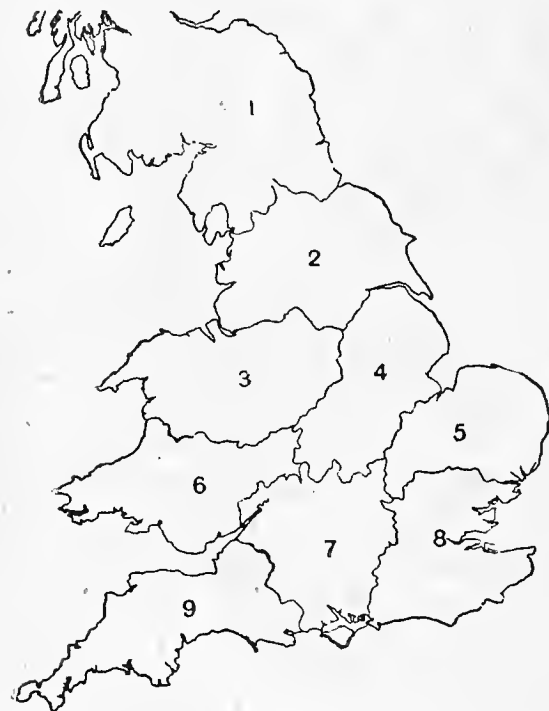

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or if sent to London (20, Tudor Street, E.C.), by the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.

York and Lancashire.

SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

SECTION X.

Scotland.

SECTION XI.

Ireland and Isle of Man.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Liffie and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

IMPORTANT NOTICE.

Owing to the
CHRISTMAS HOLIDAYS

Advertisements for the issue of 23rd inst. must reach Coventry not later than first post on Thursday, 17th Dec., and for the issue of 30th inst. not later than Wednesday, Dec. 23rd.

PLEASE READ BETWEEN THE LINES.

Mirror-Lens Lam stood mu h alike from illu-
strations, don't they? But when the details of
construction are compared, then the weak points
of the shoddy "piece-work" Lamps are exposed.

In the "ELECTARY" PROJECTOR such
points as the design of hinge c asp, clip, divided
glass, and even the Mirror-Lens itself, have been
carefully studied, and no expense has been spared
in producing a Motor Cycle Lamp which no other
Lamp can approach—NO MATTER WHAT
NAME IT IS KNOWN BY.

Do not buy your new Lamp—do not even part
with your old one (the weak points of which you
are at least familiar with) in part exchange for
something which may bring you fresh trouble—
until you have had an opportunity of comparing,
for yourself, the "ELECTARY" with any other
of any make. Don't forget—"You can't get
something for nothing."

ADDRESS—20, TUDOR STREET, LONDON. E.C.

MEMORIES OF A SUMMER TOUR. A REST BY THE WAY.

AS I entered—if you can call being literally pitchforked down a one in four grade by a couple of little red devils, an “entrance”—I saw Satan himself in the ante-chamber. He was in the act of swigging off a stiff noggin of flaming petrol, while several attendant sprites were conducting experiments with a patent fuel, requiring attention only once in twenty-four hours, and therefore promising to release a horde of stokers from the infernal regions for even more congenial duties on earth.

“Sit down,” he said pleasantly. “You’ll find the right-hand chair more comfortable; it’s lagged in asbestos. The ledgers will be along in a minute, and then we can see if you have come to your proper destination.”

I sat down very gingerly, after carefully selecting the right-hand chair; phew! it *was* hot—worse than pushing a single-gear tricar up Birdlip in August. The ledgers arrived—patent asbestos paper, binding to suit.

“H’m!” sniffed Satan, rather disappointedly. “Your worst crime seems to have been an exaggerated enthusiasm for motor cycling. I’m afraid we shan’t be able to keep you here very long. Four convictions for exceeding the speed limit. Murders—seventeen poultry, two cats, eight rabbits, and a weasel. Lies—chronic, extending over a period of nine years; defendant has consistently denied ever having had any trouble on the road, and has habitually multiplied his average speed by two and a half when swanking about it at the club. Sentence: Three weeks on the road in our special motor cyclists’ department.”

The asbestos chair was instantly whisked from under me by a hideous little fiend with a vermilion countenance, and with much whisking of forked tails and prodding with red-hot pitchforks I was unceremoniously hustled down a series of lengthy corridors, which seemed to be constructed of cast-iron in a state of incandescence.

Introduction to the Garage.

Finally we arrived at a huge door, on which was painted the word “Garage.” A police inspector was standing in front of it; at least when I say “standing” I should explain he was dismally hopping first on one leg and then on the other—a proceeding I was fain to imitate. He was disconsolately examining a large stop-watch, which had an incandescent stop-trigger, and refused to stop under any circumstances. He informed me he was not to be released until he had secured a hundred consecutive convictions, all for a speed of 26 miles 6 furlongs an hour over a measured hundred

miles. So far his three chief difficulties had been that none of the infernal motors would go; that his watch wouldn’t respond to the stop; and that it was difficult to persuade a bench to convict when they were drinking flaming petrol by the two-gallon can all through the prosecution. He hoped to be more fortunate with me.

My attendant devils blew open the garage with a charge of dynamite, and on entering—unceremoniously as before—I found a 1¼ h.p. motor bicycle of very

“Suddenly a hoarse cackle sounded in my ear . . . the leviathan chicken had descended from the garage roof, and was in literally hot pursuit.”

old pattern. Its appearance did not inspire confidence. Both its wheels were egg-shaped—owing to the “hellish” nature of the roads. The tyres were down; the belt was covered with grease; and I could see the naked piston through a large chunky hole in the cylinder wall. Looking out through the far door of the

A Motor Cyclist's Inferno.—

garage I could see the road on which the trial was to be held. It looked just like an ordinary road would look if you lay on your tummy and gazed at it close to through a strong magnifying lens; I should have compared it to the ice screeze on a Swiss moraine, if it hadn't been so confoundedly hot. Along each side of the "road" was a blazing ditch, filled with a river of petrol running at sixty miles an hour.

The Spirit of the Dead Chicken.

"That confounded hen is the real terror!" murmured the inspector dejectedly, craning his neck up to look at the roof of the garage. My eyes followed his, and I saw waiting on the roof of the garage a most Brobdingnagian chicken, about 30ft. high. A little red devil was grinding in its beak with carborundum powder, and another horde of fiends were engaged in busily filing its claws nice and sharp.

Well, to cut a long story short, they put the inspector in the ditch, ready to time me, and his blood-curdling yells will ever remain in my memory. Then they set me astraddle of the motor bicycle, and started me by jabbing with their pitchforks—well, just above the saddle. In such an atmosphere the machine scarcely waited to fire till I had dropped the valve, and she set off literally as if all the devils in hell were after

held tight, and hoped my fiery steed would soon bring me to the end of the trial. Suddenly a hoarse cackle sounded in my ear, and, glancing backwards, I saw that the leviathan chicken had descended from the garage roof, and was in literally hot pursuit, striding along at fifteen yards a stride. I saw the red light glint on the polished edges of its newly-ground jaws, reflected from the bloodshot whites of its hungry saucer eyes, and heard the metallic tang of its sharp claws on the road, flinging up the boulders astern in a thunderous shower. It was poor consolation that my front forks and silencer would probably give it indigestion if it tried to gobble me, as was its evident purpose. Suddenly there flitted across my agonised remembrance the behaviour of sundry chickens and rabbits as pursued by me in happier days on earth, and I began to double first to one side of the road and then to the other. With an almost imperceptible sway of its steering gear the gigantic chicken stealthily followed my every lurch; and finally I imitated the rabbits I myself had so often terrified, and turned, machine and all, into the flaming ditch. A colossal explosion followed, and I found myself back in the garage again. To my keen sorrow, there was the detestable old machine, apparently none the worse for the catastrophe—well, it scarcely *could* have been any worse than it was before. The inspector, looking rather singed about the gills, was there, too—still hopping, and still tinkering at his obstinate watch.

"Ugh! that infernal chicken!" he said shivering. "I wish it would get one of you, for I live in agony lest it should dip into the ditch for me."

That's Not a Standard Machine!

"Hill-climb just going to start!" announced a sort of foreman devil. "That's not a standard machine!"

It certainly wasn't; but even if it wasn't standard the most jealous competitor could hardly have been particular about seeing it disqualified.

"Tune it up!" said the foreman devil sharply. "You will be disqualified afterwards, but we all want to see you do fastest time." So I and the bike were pitchforked out at the door and round the corner double quick. I should like to pay one compliment to the way they manage hill-climbs down below; they waste no time about the preliminaries. I got to the foot of the hill, and looked at it. I could see the finishing post vertically over my head. There were V corners every three yards, and the first pitch was about 1 in 2 1/4, stiffening shortly to 2 1/4 in 1.

The inspector was fumbling away with his watch, so they stuffed it into his mouth and rammed it well down with their pitchforks. "Off," said the foreman devil. I had intended to flatly refuse to make a start, but the horde of fiends put torches to my coat tails, and jabbed away with their accursed forks. Half fainting, I toiled up the infernal grade, pushed, prodded, and pricked, until I reached the seventeenth V corner, where the road began to bend over backwards on top of my head. They prodded me a little way up this pitch, and then, machine and all, I fell back with a sickening crash to the bottom of the hill, only to spring up like greased lightning from the red-hot road.

There was a hurricane of cheers. "Fastest time on record," quoth the foreman devil, smacking his lips. Then—

"Consumption test comes next," he said cheerfully. Promptly a minor devil seized a long file, and knocked

... "I heard a fearful roar, and saw a motorist coming down the road, performing a portion of his purgatory"

her. Blue-hot gases beat out of the hole in the cylinder against my shins; the glowing handle-bar skinned my hands in a yard; and the machine bumped with its flat tyres on the great boulders of the road just like a ball rolling off a bowling green down a flight of steps. However, I was safely past the inspector, and knew there was no other policeman ahead, so I

A Motor Cyclist's Inferno.—

a ragged hole in my tank, out of which a stream of petrol issued, and immediately caught fire.

"Off!" cried the foreman devil, and they all began to run after me. Needless to say, my fuel supply was exhausted in a few hundred yards. They dragged me off my saddle and down to the ditch, forcing me to make a cup of my hands, dip them into the blazing river of petrol, and so transfer fresh supplies to my tank. As I was thus occupied I heard a fearful roar, and saw a motorist coming down the road, performing a portion of his purgatory. He was on a 100 h.p. racer, with four tyres flat, and as he was doing about ninety miles an hour the magnificent aplomb with which he kept his hurtling leviathan out of the flaming ditches further intensified my sincere admiration for a clever motorist. I was rather pleased to notice my quondam tormentor, the gigantic chicken, labouring breathlessly about half a mile in his rear. I was soon hoisted into the saddle again, and as soon dragged down to the flaming ditches for fresh supplies, but with scorched arms and blackened face I presently reached the other end of the track, and was told I had set up the record figures (for hell) of two gallons per yard.

Questions and Replies.

"Theory of the internal combustion engine comes next," monotoned the chief devil. "Search his pockets

before the examination." They ran hot spiky talons through all my pockets, and unearthed a copy of "Hints and Tips for Motor Cyclists," which was gleefully consigned to the flames. They then slammed me down into a chair, shoved asbestos paper and pens before me, and the foreman recommenced his monotone: "Dear Sir,—I have a 3½ h.p. 1908 Gaspipe, which won't go. I enclose stamped sixpenny telegram form, and shall be pleased if you will kindly put me to rights before 11 a.m., as I have entered my machine for the twenty-four hours' run of the Seven Dials Motor Cycle Club, which starts from the Monument at noon. Thanking you in anticipation, Yours truly, John Smith."

The pen hissed as I dipped it in the inkpot, my brain reeling at the magnitude of the problem. . . .

* * * * *

"Confound it, Jane!" I said angrily; "what the dickens have you made up such an enormous fire for on a day like this?"

"Please, sir, it came on to snow just after dinner," said the maid meekly, "and I thought it best, as you'd dropped off to sleep."

"Snow!" I murmured incredulously, and, rushing out, I stood bareheaded amid the falling flakes, mournfully registering a vow to be content with *one* helping of pudding next Christmas Day.

A TWO-SPEED TWIN-CYLINDER BICYCLE

LAST March, Mr. W. Bates, of Leeds, had a special motor bicycle built for use with a Montgomery sidecar, and it is the subject of the present illustration. The builder was Mr. Herbert Dennell, and the specification of the machine is as follows:

- Frame: H. Dennell's special design.
- Engine: 4½ h.p. Minerva twin with M.O.I.V.
- Carburetter: Brown and Barlow, handle-bar controlled.
- Drive: rin. belt; Roc two-speed gear and free engine.
- Saddle: Brooks B100.
- Petrol tank: Capacity, 1¼ gallons.
- Oil tank: Capacity, 1½ quarts.
- Wheels: 26in. Clincher-Dreadnought tyres.
- Entirely handle-bar control (thumb slide for spark advance).

The photograph was taken before the bicycle was quite completed, and shows it with temporary footboards and minus the belt. Mahogany footboards are now fitted, secured by spiral springs to the supports, and there is an accumulator box bridging them in front of the engine.

In sending us the particulars, Mr. Bates says: "Perhaps you may think the accumulator ignition rather old fashioned, but I found it extremely reliable on my last mount, and up to the present on this. I can any time quickly convert to magneto if ever I wish to do so. I always carry two accumulators, and keep them in the pink of condition by greasing the terminals and frequent charging."

The owner tells us he has climbed Kirkstone Pass both ways on the high gear by himself, and on the low

gear the machine will take the sidecar and passenger up almost any hill.

In our opinion, the frame is cleverly designed, for without sacrificing rigidity the frame is very low, yet the tank capacities have not been absurdly curtailed. For constant use with a sidecar, there is no need to

A Dennell Twin-cylinder Two-speed Bicycle, specially built for sidecar work.

scheme too closely for narrowness of tread; therefore the designer has been able to keep all frame tubes quite straight, and the two-speed gear makes pedalling gear unnecessary.

Motor cyclists who are contemplating the purchase of new tyres, saddles, or belts, should send to Maude's Motor Mart, Tyre Department, Powell Street, Halifax, for a copy of their new catalogue.

A DUST UP.

It was a summer's evening,
I hied me home to tea,
Astride my twin, which all the day
Had borne me faithfully.

The shades of night were falling
And ne'er a lamp had I,
Considering the circs. I thought
The limit I'll defy.

I opened up the throttle,
The spark advanced some more,
The purring of the engine then
Became a steady roar.

What ho! thought I, this is a bat,
I guess there's few could stick it,
And if they could, 'one thing's a cert.,
There's nobody could pip it.

But while I hummed along the straight
At speed enough to blind me,
Methought I heard a hooter's blare
From somewhere close behind me.

I lay my head behind the bars
And with the levers meddle,
In spite of all a wheel appears
Against my offside pedal.

He's past, it's hopeless, I am done!
My word, what is he riding?
I never thought there lived the crock
Could give me such a hiding.

At night I lay awake and think,
And in the morn I rise,
I creep into the building
Where the beaten speed-iron lies.

But I am not discouraged,
I'll wait for him again,
I've seen him once or twice along
That self-same country lane.

I face me up my contacts,
Exhaust valve springs renew,
Good strong ones put I on this time
With curses not a few.

The opening of the inlet valves
I now reduce a bit,
'Tis speed just now; for hill-climbing
I do not care a whit.

I lay in wait the same old place
Three nights I wait in vain,
The fourth, Ah! what is that I hear?
The same pip-pip again.

I quickly mount, again his wheel
Creeps up upon my right,
But now I've got a bit in hand
There's going to be a fight.

I touch the levers, now his wheel
Seems stationary there,
I hold him then; and still I have
A little more to spare.

Another notch, his wheel begins
To slowly backward go;
I tuck my knees close in and hold
My goggled headpiece low.

Another mile, a quick look round,
To see what he is worth,
He's not in sight, he's pipped, my crock's
The greatest thing on earth.

—T. E. HENINGHEM.

THE FEVER.

IT was not really a good motor cycle, although he had tried hard to persuade himself that it would be. You see, in the first place, the makers had not intended it to be one. They were ambitious, and only made what they called tricars, and what their customers had pet names for. However, after much consultation with she of the purse, he bought this machine (a 1904 pattern), leaving the seller with a light heart and a fixed conviction that the man knew not the value of that which he had sold.

Acting on the advice of a friend who knew something of motors—having once almost read a motor paper found in a railway carriage—he bought two new front tyres and painted the wicker basket.

Only one ride took place on the machine as a tricar, because, being only a woman after all, and fearing the strain on his physique, she flatly refused to go again. He was annoyed, for, as he said, the best driver may make a mistake, and oil is so very easy to forget! They kept it in the cellar, as it was good practice for Harry to take the machine to pieces and put it together again, *when* he got all the bits up in the street.

Emerged with a Motor Bicycle.

After many weeks of muttering in the bowels of the earth, and having bought two sixpenny cans of grey paint, he emerged with a motor bicycle, but minus the two-speed gear. He had tried to forget that, and was

satisfied with a belt. Chains were dirty, and the makers of his tricar had evidently great faith in them not stretching, because no provision was made for that happening.

Having no pedalling gear, he had to make what he called the running mount, although for the first half hour he ran from one knot of interested people to another, having forgot to turn the petrol on.

He also had only one brake, a front rim old bicycle pattern, which was rather liable to rip the spokes out if not used in a careful manner, but, as he explained to a friend, one can always drag one's feet on the ground to stop, although this was hardly necessary with his machine.

Every Saturday I saw him with heated brow going or returning, always hot and always returning to his nest. But one Saturday he went out wheeling the machine minus the belt, and, lo and behold! one or two weeks afterwards a sidecar with a brand new 1908 magneto motor bicycle stood outside his house.

He had evidently learnt his lesson, and decided to pay well for a decent article; no more second-hand conversions for him, and now the laugh is on his side.

I must read my *Motor Cycle*, save my pennies, and do likewise. His tales of non-stop runs amid lovely scenery, the open road, and the conquering of precipitous hills have made me sick with envy. I believe I have the fever myself.

GEO. F. COLE.

TAKE a motor cycle out to the Gold Coast! Mad idea! What about petrol?

Would the engine keep cool in that climate? These were some of my motoring friends' comments when I broached the idea; my non-motoring ones only appeared to think I was a little more insane than the average motor enthusiast. However, I happened to have been to the Coast and they had not, so I stuck to my idea, and the next thing was to cast around for a suitable machine for a land where in many places the best road is a sandy bush path about a foot wide. Where you must be ready and able to pull

up all standing at any minute to avoid going over a precipice, or breaking up your machine, and, incidentally, your neck, in a wash-out on the road; where the temperature is 140° to 160° in the sun; and where repair shops and public-houses are not.

I decided that I could not do better than a $3\frac{1}{2}$ h.p. Triumph, and need hardly say that I have never regretted my choice. The only alteration I made was to have a Fit-all two-speed gear put on, giving ratios of four and a half and nine to one.

At the end of last year I came out here, and had the luck to be stationed at Accra, which possesses the best roads in the colony.

Landing the Motor Bicycle in a Surf Boat.

Landing was an anxious moment, as I watched the surf boat with the Triumph on board come rushing on the crest of a big roller. This is the only way of landing here, and though the native canoe men are experts with the paddle, upsets are frequent, to the detriment of cargo. However, luck was with me.

Less than a week after I arrived came my first

long ride, to visit a sick man thirty miles away. Dear reader, don't laugh. Thirty miles is a big undertaking in this country, and ordinarily means going in a hammock slung on a pole with four hammock-men to carry you, and a small army of baggage-carriers, and it means being at least three days away. However, Bessie (don't be nervous, I've christened my machine Bessie) and I started off with nothing but a small grip-sack and a flask of—er, lemonade.

I had been warned that the last seven miles of my journey were up an absolutely unclimbable hill, so I was keen on giving the change-speed gear a good testing.

The first twenty miles or so were on a fairly level road, through rather uninteresting bush country, and the surface was so good, for out here, that I averaged nearly eighteen miles an hour; this on a $3\frac{1}{2}$ h.p. in perfect running order will give some idea of the road. At any moment one may come on a hole about two or three feet deep, washed out by the rain, not to mention natives rolling huge oil-casks, who, on hearing the horn, leave the cask to its own devices and incontinently "go for bush." They describe Bessie as "them devil bicycle that fit to go by himself."

At the foot of the hill I experienced a puncture. Having repaired this amid the usual crowd of admiring natives (one might be in England, only that no advice is offered), I got going again.

Gradients of 1 in $3\frac{1}{2}$.

Thank heaven for that two-speed gear. First comes a hairpin corner of the most awesome description, road about 5ft. wide, prickly pear on one side and a young precipice, with more prickly pear waiting at the

The author, A. G. Eldred, medical officer, Gold Coast Colony, Accra. Even on a motor cycle it is too hot for a coat on the Gold Coast of Africa. Mr. Eldred is another colonial motor cyclist who favours the general adoption of change speed gears.

Crossing a river. Observe native method of carrying baggage. The natives carry everything on the head, and there is a story of a native woman who went into a post office to get a penny stamp. This stamp she put on her head, and a large stone on top to keep it from blowing away, and so went home.

Motor Cycling in West Africa.—

bottom, on the other. Then a stretch of about one in, very loose and stony, and then sharp to the left, and the most awful looking hundred yards I have ever seen—loose, stony, and a grade of one in three and a half (this is not estimated, but surveyed). Jessie did not seem very worried about it, however, and certainly had a bit up her sleeve at the end.

After that I felt equal to anything, and though there were one or two bits nearly as bad, the rest was comparatively mild, and I finished the last mile or so on top gear. Total time for the twenty-eight miles, 35m. I could have had a steak on the cylinder by then, but no overheating. All this with the temperature about 140° under the sun.

On another occasion I had to go to a village in the bush, the only road (!) being a narrow sandy path led by natives, and about ten inches wide. I had to ride the whole distance (ten miles there and back) on the low gear, with my feet hanging ready to support myself each time the machine jibbed on the loose sand. Mechanically, I have had a most uneventful time. I used to be bothered with dust choking carburetter, but cured this by taking pedals off and fitting footboards, which prevented the sand from rising. Both the Triumph bicycle and Fit-all gear have behaved splendidly during the eight months I have been in Africa. I oil the engine every twenty miles, and have never had the slightest symptom of overheating, even after a miles on low gear in the hottest time of day. In petrol I average eighty to ninety miles per gallon. I find the engine requires taking down, piston scraping, and valves grinding in more often than in England, probably because of the enormous amount of dust here. My tyres are Clincher A Won, and have done splendidly. I have just got a Dreadnought, which is certainly the best for this country, or even something heavier would

be better. Petrol I brought out with me; it can be purchased here, but if one were going up country the only thing is to bring it out with one.

I use Shamrock-Gloria or Stanley Dermatine belts, and am just getting to the end of my second, after a total of about 3,000 miles.

For a machine for use in West Africa, I think the following is a suitable specification: Single-cylinder, 3 to 4 h.p., magneto and two-speed gear absolutely essential, spring forks, handle-bar control, footboards, low saddle position, large springy saddle, extra thick tyres.

In spite of the high temperature, no fear of overheating need be entertained if a good oil is used at proper intervals. I use Price's A for air-cooled engines. The magneto has given no trouble; I oil it every hundred miles, and flush out with paraffin every five hundred.

From a health point of view, motor cycling is an excellent thing out here, as the effect of the sun is diminished to an enormous extent when one is travelling at sixteen or eighteen miles per hour and creating a breeze.

The excellent running and reliability of my Triumph have been so much admired that three or four more men here have ordered new models.

In Accra itself there are quite a lot of cars—four Daimler lorries used for bringing in produce, two 6 h.p. Rovers, one 14 h.p. Star, one 9 h.p. Adler, one 6 h.p. Starling, and an old three-cylinder Panhard with solid tyres. In motor bicycles, besides my own, there is a Singer, a 5 h.p. Vindec and sidecar, a 5 h.p. twin Rex (which, by the way, the owner is afraid of, as he understands as much about motors as a cow does of ballooning), and a 1906 Triumph. The pastime is gradually increasing in popularity.

With all good wishes to readers of *The Motor Cycle*.

A. G. ELDRED.

Large patches of soft mud are the only things which effectually stop the motor bicycle, and four natives are then employed to carry the machine over the swamp in the manner shown.

The author rode ten miles along this path, all on the low gear.

The motor cycle occupies the coveted position under the village shade-tree.

MOTOR CYCLE TAXATION.

IT seems to be a foregone conclusion that increased taxation of motor cars is inevitable. That some little re-arrangement of license duties on heavy and powerful cars is desirable is not denied; but it does not follow that, because one type of motor vehicle has escaped lightly, the motor cyclist should suffer additional imposition.

The ranks of motor cyclists are quite half filled with men who, were there no such thing as a motor cycle, would run a pony and trap. Whether they use a motor cycle for business or pleasure is of no concern in this article. The original outlay for motor cycle or pony and trap is similar, although the cost of upkeep is in favour of the motor cycle. On the other hand, the cob may, and in good hands does, increase in value; the motor cycle never. The trap will usually accommodate four persons; the motor cycle, with the necessary fore, side, or rear attachment, can only carry two. No subtle sophistry can prove that the motor cycle causes greater damage to the road than the pony and trap, even admitting the former travels three times the distance covered by the latter; and when the Light Locomotives Act came into force in 1896, the Imperial Government placed the motor cycle on the fifteen shillings level along with the two-wheeled carriage. All things considered, this was a fairly reasonable arrangement, with the odds if anything in favour of the pony and trap; and were the local taxation licenses to remain it is extremely improbable that there would be any change.

In last year's Budget speech, however, Mr. Asquith intimated his intention of gathering all license duties into the Imperial Exchequer, and it is in this prospective domestic change in revenue finance that the possibility of increased motor taxation lies. It is not improbable that, if this change is made, there will be a tax of a crown or seven and sixpence on the ubiquitous push bicycle, and then there will be some fun!

The Motor Car Act of 1903.

Since the Light Locomotive Act, which removed from our roads the picturesque individual with the red flag whose duty it was to set a pace not exceeding four miles an hour to a road locomotive, and which defined the light locomotive as "... constructed that no smoke or visible vapour is emitted therefrom except from any temporary or accidental cause"—what a blessing the injunction against the vapour only affected its visibility! Since the Light Locomotive Act, which applied the carriage license duties to light locomotives, we have been saddled with the Motor Car Act of 1903.

This, among other provisions, prescribed the registration of motor vehicles and the licensing of drivers. It fixed the registration fee for motor cycles at five shillings. It is heavy enough considering its practical utility. The *raison d'être* of this item was "purposes of identification"; its only use in Great Britain is to acquaint the officials of the Excise that you are the possessor of, or, to be strictly precise, that you are anticipating delivery of, a motor cycle. In Ireland the information is carefully secreted in the office of the clerk to the registering council. Thank goodness, it requires no renewal, although there is no rebate on cancellation.

There is no registration of horses or traps!

Then the motor cyclist before venturing even down his own street must take out a driver's license, which is renewable annually, and cannot be granted to a person under fourteen years of age. And yet any mere child who can hold a pair of reins may enjoy the freedom of the road behind or on a horse without any restriction!

The Weaknesses of the Present Act.

It is not the intention of the writer here to expose the manner in which the Act of 1903 is evaded. The unscrupulous learn its weaknesses soon enough. But everybody who has a practical knowledge of its working is satisfied that both the registration and licensing of drivers are unsatisfactory, to say the least. It has been the writer's privilege to read two articles on motor legislation in the *Revenue Review*, a journal conducted and written by, and circulating among, the outdoor officials of the Inland Revenue Department. The first was from the pen of a supervisor, obviously an anti-motorist. He wanted exhausts "in the form of inverted syphons, four feet from the ground," together with the total prohibition of wind screens. The wheelbarrow of the heathen Chinese should surely be a suitable locomotion for him. The other was written by a second class officer, presumably a young fellow, who confessed he invested annually in "that five shillings-worth of formality, the driver's license." The latter article particularly illustrated the defects of the Act of 1903, and compared the taxation of horse drawn vehicles with motors. No licenses whatever are paid on a very great percentage of horse-drawn vehicles. Were our pony trap used for carrying goods in the course of trade, and we painted our name and address in any colour and anywhere that it might be visible, so long as the letters were not less than an inch long, we too should be exempt. Whether a motor bicycle in such circumstances would be permitted to be used without license is a problem which would land one in expensive litigation.

There is another item against increased license duty on motor cycles, and that is old Ireland. There are no carriage licenses in Ireland. If motor cycles are selected for a special contribution of an annual pound sterling to the Imperial Exchequer, which everybody directly interested seems to have taken for granted, it is only reasonable that the Irish motor cyclist should pay along with his English, Scottish, and Welsh brothers. Has the Government the courage to perpetrate such an injustice to Ireland? We trow not. And somehow we fancy there will be no increase in the cost of the motor cycle license.

If motor cyclists handled the business properly there would not be, for, after all, the road is not the absolute property of the man who walks, nor the man who drives donkey, mule, or horse.

R. R.

We had an opportunity a few days ago of inspecting some motor cycling breeches which are made to measure by the Bedford Riding Breeches Co., 51, Kingley Street, Regent Street, W. These breeches are well cut and well made in strong riding cords or tweeds, and are sold at a very reasonable price indeed. Those who favour leather wear for motor cycling can obtain the same kind of breeches made of this almost unwearable material at a slightly increased cost.

All there is to

A NEW BOOK

FOR

MOTOR CYCLISTS,

Price

1/2

post free

Some time ago a series of articles appeared in *The Motor Cycle* under the heading of "Useful Hints & Tips," and were greatly appreciated at the time by a large number of our readers.

These articles were of so exhaustive a nature, and covered the whole field of motor cycling in such a thoroughly sound and practical manner, that it occurred to us to reprint them in book form, with the object of supplying a text book, which might be carried in the pocket, and would be of great value to all motor cyclists, and make them able to thoroughly understand every part of the machines they drive.

Such an intensely practical, helpful book for motor cyclists has certainly not been obtainable up to now, and we would strongly recommend every reader of *The Motor Cycle* to order a copy at once.

OCCASIONAL COMMENTS.

By "IXION."

Handle-bar Control.

I continue to receive a host of letters about handle-bar control, the writers of which agree only in regarding existing patterns as faulty from a practical point of view. Two main objections are urged by my correspondents against practically every known type of handle-bar carburetter lever. One is that the sweep of the levers is either too wide, necessitating an excessive finger span, or else that the movement of the levers is in the wrong plane. I consider this unimportant; almost any type of control comes to be second nature after a few hundred miles on a machine fitted with it. The other is more serious, and relates to the vulnerable position in which such controls are generally mounted, *i.e.*, at one extremity of the steering bar, and often on its outer side. In the meantime, a combination of two ideas forwarded me by different riders strikes me as a distinct improvement. The throttle is worked by a horizontal lever inside the steering bar. When closed the lever nestles up alongside the grip; when open the lever is in the same horizontal plane as the grip, but stands out at an angle from it. The air lever consists of a thumb slide and knob *under* the bar just above the grip. This combination answers both desiderata admirably. No smash from side-slipping can derange it, and the movement is exceptionally convenient, the throttle being easily operated by the right thumb without relaxation of grip, while the air slide is comfortably managed by the forefinger.

Multiple Jet Carburetters.

"H.M." asks readers' and my opinion of a multiple jet carburetter for motor bicycles. I would not be bothered with one at any price on a $3\frac{1}{2}$ single geared roadster. I described a very simple form of by-pass jet (largely fitted by Grimshaw's, of Sunderland) some months ago in these columns. It was adaptable to practically every known make of carburetter, and was inexpensive, so it is easy for any enthusiast to test such a notion for himself. I would not have one on a $3\frac{1}{2}$ h.p. single geared roadster, because, as Hulbert has shown in actual competition, it is usually possible to get a speed range of at least four to forty-five miles per hour out of a machine of this type on a single jet. I am, however, actually contemplating fitting one to a 7 h.p. twin for 1909 in the hope that on entering traffic I can slam my main throttle shut and run sweetly at six miles an hour or so without constant finicking at the air and spark levers. Again, if free engines and two-speed gears do eventually come into general use, as seems probable, the multiple jet will soon be a standard. It is heartbreaking to hear the average amateur owner of a free engine or two-speeded machine running his engine on neutral, and he is by no means wholly to blame, for the single jet carburetter can be adjusted to run an engine slowly under load, but cannot be adjusted to run the engine slowly when light, unless two-thirds of the maximum power are sacrificed in the adjusting. For self-protection motor bicycle makers will be compelled to fit multiple jets when they attach free engines and two-speed gears as regular parts of their specification. If they don't, the duffers will knock their engines to bits in a very short time. The legal rights to these

by-pass jets appear to be in a rather chaotic state. When I first described the Grimshaw by-pass in my comments a reader claimed that it was an infringement of his patent, and now I see a third party is advertising the same notion under the accurate description of a "pilot jet." By the way, it is an invaluable fitment on noisy tricars or voiturettes.

Night Road Dangers.

I must cry, "Hear, hear," to the letter from "AH 441" (page 957, December 2nd). Unlighted sheep are the worst evil, and I have several times charged a flock of them, even when using headlights of huge candle-power. Their dirty grey fleeces look exactly like a dry, open road either in the glare of a big acetylene phare or in the faint rays of a 1s. 6d. cycle paraffin lamp. Only a month ago I pulled up just in time to avoid a regular Balaclava just north of St. Albans, the road being jammed with sheep from hedge to hedge for about a hundred yards. As I stood still and watched them pass four pedal cyclists rode straight into them and fell off. I had another narrow squeak this summer at Sunderland Bridge a few

Mr. W. Suddart, of Frizington, Cumberland, has had a double seat fitted to his Rex Litette for his wife and daughter. He tells us that tricars are very much alive in the Lake District. He has personally covered 1,200 miles on his, experiencing only two punctures, and no mechanical troubles whatever.

miles south of Durham on the Great North Road. The wet road looked black by acetylene light on this occasion, and, fortunately, I noticed that the darkness looked rather *tremulous* just where my lamp's rays blended faintly into it. I stood on the pedal of my belt rim brake, and found the road packed from wall to wall with lumbering black bullocks. The men in charge of travelling herds at night should be four in number, and should be compelled to carry lanterns on short poles, and to sound some distinctive form of noise producer, if only a tin trumpet. They invariably seem to prefer that we should run them down, and make not the faintest effort to warn the unwary of their approach. I suppose compensation promises more certain profits than the cattle market, and that the insurance valuer is more generous than a farmer with his living to make.

Sally, a Four-year Old.

By A. ALEXANDER MOODIE.

A FOUR-YEAR old. I think sometimes she is a bit more than this, judging by her ways of wickedness. She is a giraffe of the top heavy, oil spurting, compression losing, belt tearing, petrol eating, profanity provoking, nut shedding species. Occasionally she will run a whole day without mishap, but, depend upon it, she will get level with you the next time you take her out. Sometimes she will lay down and snort viciously, and if you approach too near will hurl sparks and dirty oil at you. If you foolishly persist in mounting she will find the greasiest patch of road for fifty miles round and skid. Skid, did I say? Why, you don't know the meaning of the word till Sally shows you. And if there is no grease handy, a wheel rut of modest and retiring disposition will suit her just as well. Sometimes she will not skid. You see, she has had great experience in skidding, and can skid in seven different ways at once; at all events it feels like it. But if she wants a real change instead of skidding, she will viciously chew up the belt and proceed to revolve her flywheels at about 6,000 revolutions a minute for a few seconds. Then she will stop, and look the picture of injured innocence, and persuade you that she is the victim of the ever-to-be-anathematised belt merchant.

Imagines She's at Brooklands.

Another variation is to take the bit between her teeth and imagine she is on Brooklands racing Vindecs or Triumphs. This always happens in traffic. No, not always. One day in the country ("Contour Book," No. 825) she saw, half a mile ahead, a navvy full of beer and slaughter. She immediately gave chase, and just when twenty yards away dropped the silencer. Ten yards in front she stopped, and waited for me to appease the wrath of this horny handed son of toil. It cost two shillings to do the job properly, and just when I was congratulating myself on my lucky escape she told the navvy about the silencer. At least I presume she did, for the man of corduroys walked straight up to it and picked it off the ground. The language was horrible—in fact, Sally was for once in her life ashamed—and we moved on. Talk about her liking navvies, it is nothing to her fondness for poultry. She dotes on them. It is her redeeming feature. Let her but see a flock of hens or geese on the road, and she will quiver with suppressed excitement. She will skilfully round them up like a shepherd's collie at a competition, and just for the sheer fun of the thing race them up some benighted alley or by-way leading to the regions where their good and worthy owners reside. At the psychological moment when I and these folk are calmly discussing the occurrence she will burst her back tyre. That is her way of showing mirth. And punctures, why Sally knows every move on the board; she absolutely revels in them. I have come to the conclusion that she has divided punctures, etc., into three distinct classes.

The first of these is what I call

The Chinese Cracker Puncture.

This is the sudden half-an-inch-longer-than-your-biggest-patch type—most effective on a wet night, ten miles from anywhere. In order to increase the effect,

she will fall over and embrace you while you are trying to mend it. At the same time she will disembowel the lamp. She only does this when you have plenty of matches and carbide; if you have no matches, she is content with putting it out. But the principle is the same in both cases. Then, in order to complete the job, she will knock the solutioned patch into the gravel, solution side downwards of course. Then if you blaspheme, as sure as "Ixion's" in Tartarus, she will push the tube of solution just where you are bound to put your foot on it. Occasionally she will let you mend a puncture, but only on a fine night, and finish the job off by incontinently bursting in a fresh spot five miles from home. Then you push her, curse her, and she is happy.

The next type of puncture is

The Mysterious Puncture.

This is the *pièce de résistance*. Sally has spent years over this, and at last has raised it to the dignity of a fine art. It is not really mysterious, as it can be tracked to its lair with the aid of a tube net and a few gallons of water, but don't attempt to find it without these implements. You'll never do it, and the more you try the more she enjoys it. To give you some idea of the way she works the game I will give you an example. One Sunday morning I took her out, much against her will, in order that I might qualify as a *bonâ-fide* traveller within the meaning of the Act. I could tell from the beautiful and even way in which she ran that she was contemplating some new and desperate scheme. About a mile from the haven of rest she began to monkey up the front tyre. By the time I reached my destination it was nearly deflated. After a short rest I felt fit for anything, so decided to give battle to Sally, and show her once and for all that I was master. This was in the days of youth, but I know better now. It was a blazing hot day, so my task was doubly unpleasant. Still, I had sworn a terrible oath—in fact, several—that she was to be conquered. I hoisted her up against a fence, and set to work. After much language, I mended that puncture. It was such a novel experience to get the better of Sally that I drank her health. When this was done I returned to her, only to find that out of sheer cussedness she had let the back tyre down. Some bystanders told me it was the heat of the sun, but I knew better. It was Sally.

The remaining species is the

Leaky Valve Puncture.

This is not in the strict sense of the word a puncture, but you think it is. This is where Sally has you. When you pull the tube out you are sure to dislodge some patch or other, thereby making a puncture. You mend this and put the tube back, only to find it just as bad as when you started.

It will interest our readers to know that the Nala Hub Co., 18-19, Queenhithe, London, E.C., are the wholesale agents for the well-known Nala two-speed gear. The retail agents for the gear for London and district are Messrs. H. Collier and Sons, Ltd., Herbert Road, Plumstead, London, S.E.

YULETIDE

The Editor and Staff wish all readers of "The Motor Cycle" a very Happy Christmas.

Questions and Replies

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E. C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Adjusting Magneto Chain. Escape of Oil.

(1.) There seems to be no means of taking up wear of magneto driving chain on my motor cycle. In its present state the constant knocking of chain against cover renders machine very noisy. Will it be necessary to have new chain? Present one has run about 2,000 miles. (2.) If too freely lubricated engine throws oil apparently from pulley wheel bearing. I have had this trouble ever since machine was new. Bearing is not worn, and release valve is in good order. What is the remedy?—J.G.A., Stevenage.

You will probably find that the bolts through which the bolts pass in magneto platform are oval, so that when the bolts are slackened the loose ends of the chain can be taken up by pulling the magneto along. (2.) You might try fitting a felt washer round the engine-shaft, which may have the effect of stopping the leakage. Carefully select a suitable thick oil for your engine, and give the engine half pump of oil.

Restoring Power to an Engine.

Can you please tell me why my 2½ h.p. Bradbury has lost power and speed on hills? When I had it six months or so ago it climbed all hills at a good pace. It is geared 4½ to 1, and has Castle accumulator, wipe contact and trembler coil. I have had the carburettor and petrol pipe off the machine and thoroughly cleaned them. It starts quite easily. The carburettor is a Longuemare with No. 7 spray, and the petrol rises to within ¼ in. of top of jet. Also it refuses to pick up speed quickly as it once did, but it does not misfire.—B.

engine requires tuning up. You must mention the state of compression, this is the most likely cause of the engine off in speed on hills. Stand on pedal against compression with back wheel jacked up, and if it does hold your weight for about a minute you can improve matters very considerably by first grinding in the exhaust and inlet valves and replacing the springs, which have no doubt lost some of their strength. Make certain the valve caps do not allow the compression to leak past them, and check the opening of the valves. If the compression is not as good as it might be after the above attention, it would be well to examine the piston rings. If you have brown patches on them it is proof that the gases are escaping, and new rings will be necessary.

Ratio of Gears for Passenger Work.

I am the owner of a 1907 standard 3½ h.p. Minerva fitted with the Fit-all two-speed gear. Engine pulley 4½ in., rim pulley 19 in. On the high gear I was told it was 5 to 1, and low gear 11 to 1, but I cannot make it much different than 4½ to 1. I use a Montgomery sidecar with flexible joints, and on the level road get along very nicely, but on roads which are on the incline it soon tells on the engine. My weight is fifteen stones, and passenger's weight about eleven to twelve stones, so I do not consider the performance a bad one, but I want, if possible, to get a gear of about 5½ or 6 to 1 for high gear. Can you advise me how I can get this done? Is it possible to arrange gears better if chains and toothed wheels are used?—J.R.W.

To reduce the two gears all you can do is to have the ratios of the pulleys altered. The simplest way if it can be managed would be to fit a larger belt

Mr. Bates, the owner of the two-speed twin-cylinder combination described on page 1002, has sent us a tasteful picture postcard with Christmas greetings, which is reproduced above.

rim pulley. Ascertain if a larger pulley would clear the cranked portion of the chain and back stays. Chain transmission is certainly better for passenger work, but it would most probably be necessary to strengthen the lower portion of the frame of your machine if

you fitted a chain drive, as the bicycle was not designed for such a positive transmission.

Fouling of Sparking Plugs.

I have a four-cylinder F.N., and lately I have had trouble with fouling of the two back cylinders. Strange to say, before this occurs the engine doesn't smoke at all. The oil I use at present is Price's. While riding my brother's 1½ h.p. F.N. I lubricated freely with Vacuum oil, and got a very smoky exhaust without the plug oiling up. Would it be better for me if I used Vacuum in my four-cylinder, because since it is a hydrocarbon oil it would burn before fouling the plug. Also my magneto (as set by myself) breaks 5 mm. before the piston reaches the top of compression stroke. Is this correct, or could I by advancing the armature one tooth gain more speed?—L.E.F.

You might try a change of oil as an alternative, but very often the trouble may be cured by carefully choosing the sparking plugs you use. You do not say in what position the spark lever is when the break of the magneto occurs. Magneto points should be set to break with lever fully retarded and piston on dead centre of compression and firing strokes.

READERS' REPLIES.

Misfiring at Slow Speeds.

With reference to "N.H.W.'s" query re 1908 Triumph, I had the same trouble with mine. The plug points (Oleo plug) were at the correct distance, but the central wire of the plug was a little loose, and when I had screwed the plug home and put the terminal on, apparently the wire was very close to one of the three points. When running slowly the vibration apparently brought the two into actual contact, frequently causing bad misfiring. When running fast this was not noticed as the number of vibrations of the central wire would be so great that the gap would not be interrupted long enough to cause a misfire.—ST. JOHN FRENCH BLAKE.

Wear of Tyres with Sidecar.

I note in one of your recent answers in "Questions and Replies" that you say a back tyre on a motor bicycle with sidecar will last about 1,000 miles. It may possibly interest your readers to know that a 26 in. by 2½ in. Palmer cord tyre has run 3,720 miles on the back wheel of my *tricar* at an average speed of seventeen miles an hour. The weight when loaded is 6 cwt. The fabric has given out, but the rubber on the tread is still over ¼ in. thick.—JOHN NASMITH.

The Lighter Side.

TIME TO LIGHT LAMPS.—Dec. 23rd, 4.51 p.m.; Dec. 26th, 4.53 p.m.; Dec. 30th, 4.56 p.m.

A Paper on Lamps.

"Motor Cycle Lamps" is the title of a paper to be read before members of the Auto Cycle Union at 112, Piccadilly, W., on January 7th, at 8 p.m., by Mr. P. W. Bischoff.

Speed Limit applied For.

The Richmond Town Council has resolved to apply for a ten miles limit for motor vehicles on a number of roads through Richmond, Petersham, and Kew.

Aluminium for Tank

A Coventry correspondent writes that when out motor cycling a few months ago he came across a machine of unknown make with a petrol tank made of aluminium. He thinks the tank had cast aluminium ends and tubular body with a bolt passing right through from end to end. Will the owner of this machine, or the makers of similar tanks, kindly communicate with the Editor?

Riding Position.

Mr. T. K. Hastings sends us a photograph of his latest mount—a 5 h.p. 1909 twin-cylinder Indian motor bicycle. This machine has undergone one or two alterations to make the seat lower while retaining as much as possible a forward position for the saddle. The top tube has been dropped towards the back stays for about eight inches at the rear end of the tube, and the tank bevelled off to suit it. By this means the saddle can be brought forward without raising the position of the rider.

The Increase of Motor Cycles.

The R.A.C. Journal published last week a tabulated list giving the number of motor vehicles registered up to 30th September last, compiled from returns kindly furnished to the R.A.C., the S.A.C., and the I.A.C. by the registering authorities. The table of totals is as follows:

	Private cars.	Trade vehicles.	Public conveyances.	Motor cycles.
England and Wales	63,240	11,172	5,461	57,472
Scotland	5,231	810	384	4,482
Ireland	2,910	122	35	3,072
Totals	71,381	12,104	5,880	65,026

Our figures to the end of June, 1907, gave the total number of motor cycles registered in the United Kingdom as 53,877, so that there has been an approximate increase of 11,149 in fifteen months. The increase during the twelve months ended 30th June, 1907, was not so large relatively, viz., 8,142.

The Number of Motor Vehicles Registered.

For four years the number of motor cycles registered in the United Kingdom has been given in *The Motor Cycle*, the statistics being compiled from returns furnished by the Clerks of the County Boroughs and County Councils. This year we refrained from gathering the figures together because it has come to our knowledge that in all cases the cancellations are not taken into account in the figures. Consequently, by the above means it is impossible to give accurately the number of motor cycles in use, and as the years roll by the returns must get still wider of the mark.

FUTURE EVENTS.

- Jan. 7—(Provisional) Essex M.C. Paper by Mr. H. M. Wyatt on "Magnetos."
- " 7—"Motor Cycle Lamps," a paper to be read before the Auto Cycle Union, by Mr. P. W. Bischoff.
- " 16-23—Motor Cycle Show at Madison Square Garden, New York.
- " 23—Essex M.C. Annual Dinner.
- " 23—Coventry M.C. Annual Dinner and Presentation of Prizes.
- " 30—Auto Cycle Union Annual Dinner, preceded by the Council Meeting, at the Waldorf Hotel, Aldwych, W.C.

Where Motor Cycles are Numerous.

More motor cycles have been registered in Birmingham than in any other provincial town, viz., 1,796. Liverpool coming next with 883, and Manchester third with 850.

Auxiliary Assistance.

In a certain South Kensington Exhibition a model is shown of a sailing vessel fitted with a series of hand capstans to assist in the propulsion of the ship. In the description of the model it says, "Auxiliary assistance by muscular power is used"—a term which might readily be applied to L.P.A. under certain conditions.

Proposed Tax on Petrol.

The Parliamentary correspondent of *The Autocar* has the best reasons for stating that a duty on petrol is engaging the attention of Treasury experts in connection with next year's Budget. Many interviews have been held between representatives of the departments and leading men in the motoring industry. All things considered, imposing a tax on petrol consumed certainly seems the simplest and most reliable method that could be devised.

A.C.U. Council Meeting and Dinner.

It has now been announced that the council meeting and annual dinner of the Auto Cycle Union will both be held at the Waldorf Hotel, Aldwych, W.C., on Saturday, January 30th. The council meeting will take place in the afternoon at 2.30, and the dinner at 6.30. Notices for the agenda must be in the hands of the secretary by Thursday, January 7th, 1909.

Cudham Hill on the Market.

Lord Derby has decided to dispose of his landed estates in Kent. These include 3,000 acres near Tonbridge, including the famous One Tree Hill. The Cudham portion of the property is 1,600 acres in extent, and includes Cudham Hill and the Earl's mansion at Holwood, on the Westerham Road.

An Ambitious Ruling.

The Trials Sub-committee of the Nottingham M.C.C. suggest that at all future hill-climbs the competitors machines are weighed on the spot before and after the ascent, and where the cubical capacity of the engine is a factor in the result, all the winning machines be verified in this particular as well. This ruling reads all right on paper, but we are afraid the work for the officials will be much greater than they imagine. It might be all right with a small entry, but with forty or fifty competitors the work would be practically impossible in the time allowed for an afternoon, or even an all-day competition.

Motor Union's Gift to Motor Cyclists.

The Motor Union proposes to present a button badge to all its motor cycling members. Members desirous of bringing the advantages of the half-guinea and guinea classes of membership to the notice of their friends, are invited to apply for the revised prospectus. It can be obtained post free from the secretary, 1, Albemarle Street, W.

Another Motor Bicycle Stolen.

Messrs. Heath and Wiltshire, Ltd., motor engineers, Farnham, inform us that on the night of the 14th inst. a 3 h.p. Triumph motor cycle, number supposed to be BK 102, fitted with magneto ignition, large headlight and separate generator, two toolbags (maker's name unknown), was stolen from their premises. Tools and other articles were also taken. Messrs. Heath and Wiltshire, Ltd., will be grateful to anyone who can give them news of the missing machine.

AN UP-TO-DATE BURGLAR.

By MONTAGUE GREENWOOD.

GEORGE TROOPER was always welcome wherever he went. Hotel proprietors, landladies—in fact, all the people who cater for birds of passage—were pleased with his quiet ways. He was always paid up without making any unkind remarks, whether their charges were exorbitant or not. Their only regret was that he seldom, if ever, patronised them a second time. There were very good reasons for his little peculiarity. Only a very select few were aware of the cause. To the public eye he was merely a motor cycle rider, touring about the country. The few motor enthusiasts who had had the opportunity of examining his machine (he avoided these attentions as much as possible) had marvelled at its completeness as a touring mount. Everything that could eliminate or speedily cure a breakdown seemed to be there. The engine was a beautiful specimen of its class, a twin of 10 h.p. The exhaust ports, pipes, and silencer were exceptionally large, making the engine practically silent. A double system of ignition was installed—magneto and accumulator. Large compression taps were fitted, with taps directly above them to supply paraffin for easy starting. No one except the owner himself had seen his complete kit. They would certainly have marvelled more than they did if they had. A beautiful set of all reasonably portable spares were neatly arranged in their special compartments—spares that George Trooper knew would positively fit, all having been actually used for that very purpose. Every useful tool was in the roll ready to be slipped from its top when wanted. All this was right enough. Secret pockets and places on the bicycle could tell a different tale. Several sets of identification plates, with letters representing widely separated counties; driving licenses ditto, with different names on them; a very special set of tools, which included one that the simple-minded might have taken for a tyre lever. George Trooper, with his many *aliases*, was a good sample of the up-to-date burglar.

No Mere Pot-hunter

It must be understood that he was no mere vulgar pot-hunter. Appropriation of plate and bulky valuables and no attractions for him. Jewellery and papers of value were his speciality. Considerable success had been his fortune. He always took every possible precaution. Country house robberies during the evening dinner hours were his speciality, the best of information being obtained generally by a confederate from the servants. A ladder and the run of the bedrooms ensured hauls which were decidedly lucrative, and little short of marvellous for their apparent audacity. His trusty motor was always waiting at some convenient spot. A few sets of identification plates, different kind of goggles, a white instead of a black coat, and his own mother wouldn't know him. George Trooper was far too clever to keep the stolen proceeds for more than a few hours. He generally buried them. A safe time afterwards, an old gentleman would visit the neighbourhood, and dig up ferns for his collection. The old botanist was a good chum of George Trooper's.

A beautiful spring morning, and we see him skilfully threading his way through the maze of tramlines and other obstacles which one meets in suburban London.

George was setting out on one of his little excursions. At last he was clear of Greater London. A beautiful stretch of country road lay before him. Quickening his pace, he was soon reeling off the miles. He felt in splendid spirits. Dry roads and beautiful weather, combined with all particulars relating to a certain big country house, which was his goal, were the cause for this. It was his intention of putting up for one night at Bristol, a town from which he was now several miles distant. He preferred large places for his evil purposes, his presence being less noticeable.

His Cautious Methods.

Although travelling on the main road, which went straight to his destination, without hesitating he slackened speed, and turned down a side one. His methods of entering a town were sometimes peculiar. In an hour he found himself the opposite side of Bristol. Running into the town, he put up at a motoring house. A welcome drink at the bar and a casual remark that he had had a good run from South Wales completed his satisfaction. In the privacy of his bedroom he carefully went over the plans of "The Grange"; position of tool-house, with ladder; the balcony running along outside the bedroom windows were all clearly shown. An adjoining plantation would make splendid cover for the bike. Turning in, sleep came quickly to him.

The morning found him lazily enjoying a late breakfast. All his energies would be required that night.

Carefully filling up with petrol and lubricating oil, he tested the running of the engine on the stand to make sure all was in order. George Trooper was very exacting in the starting up qualities of his engine from the cold. Nothing but the quickest results would satisfy him. Moreover, he knew how to get them.

"The Grange" was two miles from Bristol. Being his intention to make a circuitous route, he went in an opposite direction. The sun was setting over the plantation as he finally stopped at the roadside. Putting the stand down, he lighted a cigarette, and had a stroll round. It was highly desirable to see that the coast was clear before putting the motor in the plantation, the gateway of which was adjoining the road. It really was a beautiful evening. A beautiful afterglow spread over the sylvan scene; the peacefulness of the close of day was in the air. Rabbits gambolled on the velvety patches of turf in the heather and gorse. The birds gave their finishing pipes as they settled in their nests for the night. George Trooper enjoyed the scene, being a man of no mean intellect, although his opinions on the rights of ownership were so unorthodox. Redistribution of wealth, he called it. It never could be said that he took from the poor. Temporary inability to make the dazzling display of jewellery that they had was his victims' worst grievance. The checking of vanity should have a chastening effect on their spirits, he always argued.

A Useful Coup.

Finishing his meditations, he quickly set to work. There was no one about. Soon his motor was between the fir trees in the plantation. A handy stump kept

An Up-to-Date Burglar.—

the machine upright. Putting on new number plates; trying the electric head lamp, being careful not to show the light; testing coil ignition, which he used for starting; and injecting a little paraffin into each cylinder beforehand, he went off, leaving everything ready. He next donned a pair of thin rubber gloves. Keeping a good look-out, he was soon in the shrubbery of "The Grange." It adjoined the far end of the plantation. It was fairly dark, but he could just see the tool-house. The ladder hung on a couple of brackets under its roof. Lifting it off, he soon had it against the one end of the bedroom balcony. Everything was quiet, and there were no lights except on the ground floor. Room after room he visited, with more or less luck. Descending the ladder with care, he took it down and put it in a long row of bushes. No

one would tell from outside that he had been. This might give him extra time.

Quickly going back to his bike, he pushed it through the gate into the road. Shutting the gate and starting were the work of a few moments. Then there was the barking of dogs from the direction of the house; the sound, however, soon faded away in the distance at the rate he was going. Telephones and telegraphs go quickly, so he soon slowed down at a spot he charted and prepared that afternoon. Lifting a flattish stone, half hidden in the bracken, by the roadside, showed a deep hole. Clearing his pockets of the plunder, he put it into several small bags, and deposited them with his tools in the hole, and carefully replaced the stone.

A couple of hours later he was enjoying a good supper in the best of spirits. Success had again crowned his efforts.

CLUB NEWS.

A Motor Cycle Club for Warrington.

An informal meeting will be held on January 21st, 1909, at the Hall Café, Stockton Heath, Warrington, at 8 p.m. prompt. The purpose of the meeting is to consider the question of forming a motor cycle club for Warrington and district, and the secretary *pro tem.*, Mr. Kenneth T. Hardman, 49, Cawdor Street, Stockton Heath, Warrington, hopes to receive a hearty response from motor cyclists in the district.

Lantern Slides.

In the last issue we mentioned that Mr. J. W. Robertson, of the Perth and District M.C.C., recently gave an interesting lecture illustrated by a series of lantern slides made from photographs furnished by *The Motor Cycle*. Mr. Robertson has now favoured us with a list of these slides, thinking that other club secretaries might like to hire them for a similar purpose. Mr. Robertson's address is 192, High Street, Perth.

Nottingham and District M.C.C.

A committee meeting was held at headquarters, the Welbeck Hotel, on the 15th inst. Present: Messrs. J. Elliot Littlewood (in the chair), R. T. Whaley, F. Mitchell, G. Chudleigh Holmes, Geo. Brough, Wm. T. Smith, E. G. Young, W. E. Brough, F. W. Dance, and the hon. secretary.

Letters from Dr. A. Fulton, Capt. Bagnall-Wild, and Mr. Chas. Hardy were read *re* small cars competing in motor cycle events, all the said gentlemen being entirely in favour of the exclusion of such small cars from these events in future.

The secretary had also received a letter from Lord Hy. Bentinck in connection with the club, congratulating the committee on its successful establishment.

Mr. H. W. Bircumshaw was unanimously elected a vice-president of the club.

Mr. J. Van Hooydonk has kindly offered to lecture, assisted by lantern illustrations, to the members of the club one Saturday early in January.

The Trials Sub-committee report the following as their decision with regard to the Bunny hill-climbing competition. Prof. Callender's formula was used:

	Fig. of merit.
1. L. A. Nolan00608
2. Geo. Brough00606
3. W. Reilly00505

The committee regret that the inaccurate entry forms of some of the competitors necessitated the verification of details, and thus hindered the declaration of the result until the present time. Moreover, they suggest that in all future competitions, especially those of this character, the following byelaws be adopted:

1. That, where the weight of the machine is a factor in the result, all machines be weighed on the spot, immediately before and again immediately after such competition.
2. That in the case of speed tests all cut-outs be officially sealed and examined.
3. That, where the cubical capacity of the engine is a factor in the result, all the winning machines to be verified in this particular as well.

INVERTED LEVERS ON HANDLE-BAR.

AFTER visiting the Stanley Show, a reader asks: "Why will firms fit inverted levers for brake and valve lifter? It is considered bad practice by cycle manufacturers, involving, as it does hidden wires, awkward turns, and an ever present possibility of nipping one's clothes in the levers." The above question is certainly an unusual one, and we thought that the advantages of the inverted lever were obvious to all riders. Relying on the grip of the handles is all very well on a smooth road, but when travelling at a good speed, if the front wheel should suddenly drop into a hole in the road, the hands will as likely as not slip off the ends of the grips, and this might prove serious. With inverted levers this contingency is rendered impossible, and personally we much prefer the inverted type of handle-bar lever. We will admit that there is a slight possibility of the coat sleeve being caught in the mechanism—as far as we can remember it has occurred in our case three times in a

couple of years—but a guard could easily be fitted to prevent this. Hooked end handles were far more in evidence at the recent show than in former years, which goes to prove that their advantages are being more generally recognised.

"Road Rider" asks us to correct a press error in "Hints and Tips." When he was writing his notes on belts he had not tried the Whittle belt, and, having heard glowing opinions of it, he made a test. The belt was fitted rather slack to a tricar which was almost dead silent, and the looseness set up a sort of hum or jingle, which he mentioned in his notes. He has since tested the belt with a proper adjustment, and found it excellent; but, unfortunately, in the hurry of going to press he omitted to correct his first impression. He desires to heartily recommend the Whittle belt, especially for heavy passenger work.

"Motor Cycles at the Stanley Show." *

THE discussion was opened by Mr. W. H. Wells. Of two pistons which had been handed round, he stated that he preferred the one with a recess between the two rings, though he failed to see how the oil got to the top ring. Mr. Cove had mentioned the fitting of a pipe from the petrol tank to the compression tap. This, he thought, would do great harm, as petrol injected into the cylinder tended to dry up the oil, with the result that for perhaps a mile the rider was travelling with an unlubricated cylinder. Personally, he infinitely preferred paraffin, which was undoubtedly the best. The lecturer referred to some of the motor bicycle frames being too short. In his opinion, the tendency was now to shorten frames, so as to enable the machine to turn corners conveniently. As regards silencers, he pleaded guilty to having fitted on his machines previously silencers which were not so effective as they might have been. He had, however, brought out a new model. As regards sidecars, he agreed with Mr. Cove that they must not be too elaborate. He agreed that in some cases the backs of these were too upright, and he was now having built by Messrs. Mills and Fulford a sidecar which conformed to his ideas. He preferred the seat to be of wicker instead of heavier material. As regards tyres, he regretted to find that Mr. Cove had not mentioned the Michelin Semelle type, which is both resilient and efficient, and most effective against side-slip. On the other hand, for speed work he infinitely preferred the wired-on Dunlop. As regards lamps, he thought the Lucas separate generator lamp shown was rather heavy, and stated that he preferred a lighter model. Mr. Wells spoke most eulogistically about the Brooks 105 saddle, which enabled the rider to sit within 30in. of the ground.

Front Brakes Favoured.

Mr. A. E. Lowe said, as regards the question of brakes, he certainly thought that makers were shirking their duty in this respect. Undoubtedly the reason was due to the increasing popularity of spring forks, which rendered the fitting of front brakes somewhat difficult. He regretted that among the lightweights the Douglas motor bicycle had not been mentioned. From a mechanical point of view he considered this machine to be excellent.

Mr. P. W. Bischoff agreed with Mr. Lowe as regards front brakes, stating that, in the event of the back tyre being slack, the rider would not wish to apply a back brake, and this was a case where a brake on the front wheel would come in. On the other hand, if, as the tendency is at present, the back wheel is fitted with two brakes, one is strong enough to lock it, and what, he asked, was the use of the other? He considered it to be futile. He also referred to some experiments which had been carried out by Mr. Mervyn O'Gorman with models of cars with front wheel brakes which, when placed on a greasy road, continued in a straight line, whereas locked back wheels caused them to turn completely round. Mr. Cove referred to machines finished in grey. The machine which struck him particularly at the Stanley Show was the Phänomen, which he considered—from the point of view of colour at any rate—to be a very attractive machine. As regards tyres, he must say he had had most happy experiences with Clinchers on his present machine. He had a front cover which had been 3,700 miles without retreading, and a back cover which had covered 4,000 miles and had only been retreaded once. As regards Price's Patent Candle Co., to which reference had been made, he noticed on their stand a new oil—Sherwood sperm oil—which was specially suitable for magnetos. As regards the separate generator lamp under discussion, he thought that its weak points were the back glare through the ventilation holes, which dazzled the rider's eyes, and the fact that the burners were fitted with too small a union. These points, he understood, were being dealt with.

Mr. J. W. G. Brooker also declared himself to be a supporter of front wheel brakes. He especially liked the piston with rings at the top and bottom, so that it was supported at both ends, while there was a space for oil between. He also enlarged upon the evil of loosening piston rings with petrol, as this tended towards the deposition of carbon. He referred to the convenient position of the Humber lubricator pump, though he thought dust would be likely to enter at the filler, but this may be altered. Mr. Cove had men-

tioned that he considered the 2½ h.p. F.N. was about 10 or 20 lbs. too heavy, but he thought the weight no detriment. He was particularly pleased to see that the F.N. had both a drip lubricator and a force pump.

Mr. Warner spoke upon the excellence of clutches, and mentioned how they could be slipped on a hill and have almost the same effect as a two-speed gear. Someone had mentioned the Douglas. Personally, as far as he was concerned, he considered that the chief fault it possesses is the extra lip on the piston, which he considered was likely to cause extra wear.

Mr. R. M. Brice thoroughly agreed that brakes should be fitted to both wheels. As regards black *versus* grey enamel, he considered that the black was more durable. He criticised the domed piston with rings at top and bottom, and said that he thought these were rather too heavy. As regards the lamp under consideration, he thought that the distance between the front of the lamp and the clip was too great, imposing, therefore, too great a strain upon the latter and the bracket. He thought that tyre makers did not pay sufficient attention to motor cycle covers. As regards studded covers, he considered that the studs wore quickly, and then the machine slipped as badly as ever, and they were also liable to puncture. He thought that the fact of having inefficient silencers was due to the motor cycling public, many of whom were given to knocking out the inside of their silencers so as to get, as they thought, more power.

Mr. Siffken criticised inverted levers for the working of the exhaust lifter, and declared that they required more power to operate than the ordinary type of lever. Touching asbestos in silencers, he considered that this caused too much heat to be retained. As regards the comfort of sidecars, he thought that if the front of the seat was sprung they would be better. He emphasised the importance of standardising rims and tyres, and regretted that Kempshall tyres had not been mentioned.

Mr. F. Canham spoke of the importance of strongly-built lamps, and mentioned the desirability of some device to keep off the excessive glare. Dealing with speed indicators, he thought that it would involve the use of too much mechanism to make the needle travel further round than was the case with the speedometer criticised by Mr. Cove.

Mr. Durrant enlarged upon the desirability of sprung wheel sidecars.

Mr. A. Hunter begged to differ from Mr. Siffken's opinion on inverted levers. He had found them to be satisfactory, and infinitely better for cleaning, as they were not fastened by a clip, as in the case of the ordinary lever.

Mr. Smith said he thought that cut-outs ought to be fitted to all silencers, and that they should be closed when the driver was passing through towns.

Mr. Chatterton (in the chair) reviewed what had been said by the previous speakers, and then called for Mr. Cove to reply.

The Lecturer's Reply to Criticisms.

Mr. Cove, in reply, thanked the chairman for his remarks. He considered Mr. Wells's remarks about the piston, as coming from a man who knew what he was talking about. Personally, he liked a long machine. He had only dealt with touring machines in his paper, and though a short machine would be better in hill-climbing, for ordinary road use he preferred a longer frame and wheels with large tyres. Touching on sidecars, he especially admired the sidecar seat of the Oakleigh. With regard to the Vindec machine, he had been specially interested in the pedal retainer, which prevented the pedals from revolving. With mechanically-operated valves he had had some experience, and he preferred the other type. In his opinion, the best make of twin-cylinder machine was fitted with the automatic type of valve. Mr. Brice had said that he found black enamel to be more durable than other colours. He himself had found it to chip. Mr. Smith had mentioned cut-outs. He would like to call the attention of those persons to the fact that the A.C.U. had tried their very best to abolish these, and in the Land's End to John-o'-Groat's Trial cut-outs had been sealed up and the holes in the silencers had been slightly enlarged with no bad effect. He did not think that the separate generator lamp referred to was too heavy. The makers supplied a special bracket, and if this bracket were fitted the weight did not matter. As regards sidecars, he preferred the rigid pattern.

* Summary of the discussion on Mr. Cove's paper, read on the 10th inst. before the Essex Motor Club.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Tandem Attachments.

[3737].—With regard to "C. M. F.'s" letter [No. 3699] on rear tandem passenger attachment, in the issue of December 2nd, he there states that any standard $3\frac{1}{2}$ h.p. machine will take a rider and passenger with this attachment faster than a machine fitted with sidecar of double or greater power. I am myself the possessor of a 5 h.p. twin Rex, with Mills and Fulford sidecar, and have done forty miles an hour over a level mile with passenger. I should conclude from this that a 7 h.p. Peugeot (double the power mentioned) fitted with light sidecar could easily attain, with passenger, fifty miles per hour, and as there are very few $3\frac{1}{2}$ h.p. machines capable of this speed under ordinary circumstances, they would be still less able to perform this feat with a passenger of say, 11-12 stones.

VICTOR VAUGHAN.

Road Dangers at Night.

[3738].—I am interested to see that mention has been made in your columns of the lighting of traffic on the roads at night and the danger of running into hay waggons and similar slow moving vehicles which show no light behind and cannot be seen until one is quite near them. I had a similar experience to that of a recent correspondent. In a narrow lane, with hardly room to pass, I came suddenly upon a hay cart. I should like to mention also the danger of running into riders on horseback. One night I was suddenly aware of a horse dancing all across the road in front of me. I was forced to run on the footpath to pass. I hope the time is not far distant when all users of the road at night will be compelled to carry a light of some sort to show their whereabouts.

F. G.

[3739].—I hope you will allow me a little space in *The Motor Cycle*, to which I am always looking forward. It is very seldom I answer correspondents, but I feel in duty bound to say a little with reference to "AH 441." I am sorry to hear that he has experienced danger riding at night, as I am inclined to think that if he cannot see a full load of hay even in the dark he must be travelling at a dangerous speed, and probably be on top of it before he knew where he was.

Now I am a motor cyclist, and have been for nearly two years, and have never met with a single accident yet, but the point I wish to tackle (because I happen to be in the hay and straw business) is that he requires us to carry a light behind. As the law stands a light is compulsory in front, which I consider quite sufficient for any driver that has two horses to contend with, as he cannot pretend to keep leaving his horses to see if the light behind is burning. It seems to me that he requires all live stock cleared off the road at night just for the pleasure of motorists, but I can assure him that this will never be. Live stock was here before motor cars or cycles were ever thought of. Motors run away sometimes, and very often get out of control.

I hope that "AH 441" will not think that I am running motors down. Far from it. I agree that every moving vehicle should carry a light in front and showing from the same lamp a red light behind. On our lorries we have ordinary swing lamps, at 3s. each, which hang from the off-side of the lorry on the lock, and are about 18in. from the ground, and can be seen from any position by those on foot.

Why I strongly object is because hay and straw are very inflammable, and if the lamp behind should get on fire, what would happen? Only twelve months last November a school-boy threw a small bonbon into a load of straw. The bonbon fused inside the straw, and in less than two ticks it was in flames, and after a hard struggle in liberating the horses, the flames were subdued after damaging about one ton of straw, but had the man been single-handed and in a country lane

the lot would have gone. I mention this to let you see what drivers of heavy vehicles have to contend with. If a lamp was attached behind, the urchins would everlastingly be swinging on behind and playing pranks with the lamp. I will say this, turning horses out of a farmyard on to a main road to water is a very dangerous practice, and ought to be stopped.

I hope my views regarding lights on slow moving vehicles will satisfy every motorist, as I consider one lamp hanging on the front and suspended from the lock, also showing a red light from the same lamp will keep all danger away.

BN 192.

High v. Low Compression Engines.

[3740].—I was sorry to see at the recent Stanley Show that some makers were listing extra light machines with high compression engines. Can the retailing of such a machine do any good to the pastime? In the first place, it makes hill-climbs impossible for the ordinary man, who can only afford to keep one machine—as everyone knows these high compression engines are much faster than the ordinary touring machines—and secondly, it is a type that possesses so many disadvantages that, in the hands of a novice, would disgust him with the sport. Would it not be better if manufacturers, instead of wasting their time on these ultra-light high speed machines, would attempt to design an engine capable of standing up to its work better than the present-day engine does? One hears on all sides complaints of 1908 engines which, after covering a short distance, develop shake in their bearings, wear their cylinders oval, and even blow them off. The way the old $2\frac{3}{4}$ h.p. De Dions have worn is an object lesson to the modern manufacturer. May we see at the next Stanley Show engines of which their makers boast not of the pace up Birdlip, but of the length and diameter of the bearings.

CLAUDE BARFIELD.

The Future of the Tricar.

[3741].—I read with interest Mr. Meers's commentary on Mr. Davies's paper on tricars, in your issue of the 9th inst. I have driven a motor cycle and sidecar, fitted with Oppermann three-speed gear, and found the latter very efficient. I have, however, great trouble with the engine chain (forty links) which rarely lasts more than 500 miles. I have renewed the sprockets, but still find the rollers snap and side links fail. I should be glad to know if Mr. Meers has experienced similar trouble, and what chain he uses. The long driving chain has stood some 4,000 miles running, and shows little sign of wear. I may add that the engine is a 3 h.p. water-cooled Fafnir, and the combination will take driver and passenger about 19 stones up the worst hill to be encountered on main roads in the neighbourhood.

W. H. C.

[3742].—I have read the tricar articles and correspondence in *The Motor Cycle* with great interest. That the tricar is dead, no one having the use of his eyesight will deny.

I note that you advocate a revival of the light air-cooled form, and have recently illustrated your ideas on the subject. Now that we have such perfect two-speeded twin motor cycles this form of tricar has become possible, but it will never be popular for the simple reason that it possesses the very fault that has killed all other (modern) tricars—the tandem seating of passenger and driver. It was the strong feeling against the forecar and trailer that produced the sidecar, and I think that the natural evolution of the sidecar is to put the bicycle in the central position, drive both rear wheels, and give the driver the same comfort as the passenger.

My idea of design is a powerful twin bicycle (minus its back wheel) with two-speed gear and clutch of Phelon and

Moore or Chater-Lea type in crank bracket, to which add an axle (with a differential), set some distance further back than the fork-ends of the cycle frame. We shall then have the air-cooled engine in its proper place—in front—where it will be well sprung by its own spring forks; driver and passenger will both be comfortably seated in a well-sprung upholstered seat. The control and steering can be brought to rear end of bicycle frame, where they will be in a convenient place for the driver. With this arrangement the only special fitting will be the back axle, but if made in quantities by such firms as Chater-Lea they need not be very expensive. I see that several new light four-wheelers drive only one wheel, but this seems a poor makeshift. This arrangement is found on children's tricycles at 30s. each, where the reason is more apparent. A glance at the illustration of the German electrically-driven tricycle on page 879 will show what comfort is possible. Substitute one's favourite twin for the electrically-driven front wheel, and we should have something infinitely more satisfactory than any tandem—dead, living, or unborn. If shaft drive be preferred to chain, we have the four-cylinder F.N., with change-speed gear as an alternative.

W. B. G.

[3743.]—I have been reading with great interest the recent correspondence that has been appearing in your paper on the subject of the tricar. Whether at home this kind of vehicle is getting less popular or not I am not in a position to say. I have been using a 1907 5-6 h.p. Phoenix Trimo for over eighteen months. Being a Government civil engineer I have a good deal of road travelling to do, and the roads are not always of the best description. I must say I have found the Trimo most useful and convenient and comfortable for my work. I may say at once that I don't believe in break-neck speed, neither will some of the roads out here allow of it, but an average of twelve to fifteen miles an hour is quite enough for the needs of any district officer in this country, especially with a lady passenger. Some of the roads here are very heavily cambered, and also have ruts made by heavy bullock cart traffic, but I have never had any accident or any experience such as your correspondents describe of the machine turning over into the gutter owing to the swing of the back seat. On first-class roads I have often driven at twenty miles an hour without having to adhere to the crown of the road all the time.

As regards my machine, and tricars in general as a matter of fact (more particularly the heavier kind), I cannot help pointing out that the great weakness lies in the rear wheel. For the first few months I had to spend a fortune in tyres (for the back wheel), as the original and spares supplied with my machine (2½ in. motor cycle tyres) could not stand the strain. At last, under the advice of a friend, I changed the rim and put on a heavy 650 by 65 car tyre and air tube. I have had no trouble whatever since (i.e., for nearly seven months). Possibly this takes away slightly from the lightness and speed, but for a business man high speed is not of so much importance as "getting there." I hope in future the makers will always provide car tyres for the driving wheel.

As regards the two-speed gear I quite agree that the band does require very delicate adjustment, but by keeping it always very tight, and using the clutch for freeing the engine, the difficulty can easily be overcome. I think the adjustment ought to have a little more play. As for the high gear, which is a direct drive from the engine, and is really a cone metal-to-metal clutch, nothing could be more delightful to manipulate.

On the whole, I must say for comfort and pleasure, combined with usefulness, the Phoenix Trimo will take a lot of beating. Its price perhaps is slightly high compared with second-hand De Dions in this country, for which there is a great sale. The upkeep, especially petrol consumption, is very little, and no chauffeur or lad is wanted, as in the case of a car out here. It is light and handy, and particularly convenient for taking about by rail, as it easily goes in the brake van of a passenger train. All my friends are much struck with my Trimo as a "neat handy little runabout," and it is a pity that it is not more generally known in India. Mine is apparently the only one in Bombay Presidency, and I cannot make out the reason. Motor cycles and cars are increasing every day, including cheap and nasty ones, and second-hand De Dions seem to be the rage.

I must not conclude my remarks without a reference to the engine. It is certainly the best of its kind, a splendid hill-

climber, and I have never had the least trouble with it. Although I have been using it almost every day since I have had it, the piston rings and other parts do not show the least sign of wear, and the power and compression are as good as they were when new.

I need hardly say, being a Government servant, I have no business connection with the Phoenix or any firm.

Poona.

INDIAN ENGINEER.

Pistons with Rings Top and Bottom.

[3744.]—I have not seen the case put in the following light, and possibly it may be of interest:

Reflections of a novice on the two ring piston top and bottom. No reflection on the makers thereof, who no doubt know what they are doing.

The idea of having a bearing top and bottom seems very good. But why should the bottom ring be gas tight? Surely the sooner the gas is stopped getting past the piston

the better; therefore, stop it if you can at the top. If one ring will not do it, use two.

Then the only function of the ring below the gudgeon pin is that of a guide or bearing. If it is gastight, it will prevent lubrication of the top ring for at least some part of the piston travel.

I would suggest a piston made as follows: Fit piston with one wide stepped ring

at top with two grooves round it—wide, because the steps easily break off narrow ones, and grooved because it would retain some oil for lubrication, and the friction surface would be reduced.

At the bottom of piston fit a ring with transverse slots all round it (see sketch) to allow lubrication to pass, but make the slots diagonal to prevent scoring the cylinder walls, and so form the bottom guide or bearing.

REUB. G. NORMAN.

Simplifying Starting by Handle.

[3745.]—In reply to "Essex" (page 880), I would mention that when I bought my Roc Messrs. Wall very kindly suggested that I might find it a convenience if they fitted the machine with an auxiliary exhaust valve lift. This took the form of a short length of handle-bar tubing, having the usual horn handle, and was fixed to the saddle L pin. This handle-bar carried a Bowden exhaust lever—a duplicate of that on the steering handle-bar. As arranged, it is most convenient for holding up the machine and for raising the exhaust valve when starting up, and no doubt Messrs. Wall would readily fit one to "Essex's" machine. It is well worth its small cost.

About this time last year there was an enquiry as to the strength and wearing qualities of the Roc two-speed gear, and after a season's use I can only say that mine is, if anything, better than new. It has been suggested that it is quite strong enough for a small car, and as there are eight pinions, each ½ in. thick, I should think this no exaggeration.

I myself am a lightweight, and the wrong side of fifty, and if there was any hard work attached to the starting or manipulation of the Roc I should have to give it up; but I find by first seeing that the pistons are quite free—my machine being fitted with a twin-engine with mechanical valves—I arrange that the rear inlet valve is off its seat, and then inject a fair quantity of paraffin through the compression cocks, which are placed just over the exhaust valves. Under these circumstances both exhaust valves are closed. I lean the machine to the left and slowly turn the handle. The compression cocks being open, the pistons soon become free, and then I give each cylinder a squirt of petrol, close the compression cocks, open throttle rather more than half-way, advance the spark (magneto) nearly fully, close air, flood, and a turn and a half of the handle, and it fires. When warm, it is only necessary to adjust the handles and flood it, and it will start first trial time after time, the reason, in great measure, being that the starting handle is fitted to the live axle of the back wheel. One turn of this handle, therefore, means four revolutions of the engine. The magneto therefore gives such a hot spark that there is no difficulty in getting it to start.

During the season I have had absolutely no trouble with either the clutch or two-speed gear, and my experience has

proved them over and over again invaluable in traffic, enabling you to travel at any pace, stop, restart, stop again and restart, the engine running all the time; in wending your way through cattle or sheep; if stopped in the middle of a steep hill you can easily restart; take greasy tramlines cautiously; and, not least, start easily and safely on a dark night on the filthiest grease.

I saw many nice things at the show, but not one would I have, whether light or heavy, that was not fitted with a free engine and two-speed gear. They are a *sine qua non*, and my experience makes me plump for the Roc.

E. J. SMITH.

Magneto Manufacture.

[3746.]—I have read with interest the letter of the Premier Accumulator Co., Ltd. [3701], and the correspondence leading up thereto, but regret that, while being desirous of supporting British manufactures, a limited experience has led me to believe that, at any rate in connection with ignition coils, the foreign-made article is superior.

I have within my reach at the present moment coils by three leading English makers (not all owned by me) which on my own and friends' motors have proved undoubtedly unsatisfactory and unreliable, and which have been replaced by coils of foreign make, giving complete satisfaction. As regards one of the English coils, I may say that it has been returned twice to the makers. On the first occasion, when quite new, they were so satisfied (!) with it that they entirely reconstructed the trembler mechanism.

S. G. L.

Dome Topped Pistons.

[3747.]—I have run one of the new Triumph pistons some 2,000 miles, and, having had a good deal of trouble with the old type, owing to knocking and loss of compression, I can fully endorse all that the makers claim for it as being a very real improvement. The compression seems to be, practically speaking, as good after 1,500 miles as before, and there is no sign of knocking, unless the engine is badly overloaded. I find the engine gets noticeably hotter, and in summer will probably require closer attention to lubrication; but this, I imagine, is due, not to the piston, but to the higher compression employed. With regard to "Flat Top's" queries as to carbonisation, I have found very little difference between the old type and the new. The carbon is equally distributed over the whole surface, and is just as easily removed except from the ridge round the edge, the advantage of which I do not quite gather.

I do not suppose that the dome has any mechanical superiority over the flat top, except that it brings the edge of the piston relatively lower in the cylinder, and so checks knocking. Nor do I quite see why, when all the car-makers seem to be aiming at reduced weight in the manufacture of pistons, the new Triumph piston has been made so much heavier. Perhaps someone better informed would explain this point; the Triumph people usually have some very good reason for any innovation they introduce into their work.

Mr. Cattell may be right in saying that three rings are better than two; but if two perform their task so efficiently, I do not myself see the need of anything more; and I should have thought that on the score of friction the extra ring would discount the advantage of its presence.

R. E. S. SPENDER.

A.O.I.V. v. M.O.I.V.

[3748.]—Mr. H. G. Cove, in his very interesting paper on "Motor Cycles, Accessories, and Novelties at the Stanley Show, 1908," which was read before the members of the Essex Motor Club, states that he is a firm believer in the automatic type of inlet valve for motor cycle engines, and that his belief is arrived at after extensive tests. However, in the discussion which followed, there seemed to be quite a consensus of opinion in favour of the m.o.i.v.

While I will not admit for one minute to question the practicability and success of the m.o.i. valve for single-cylinder engines, although personally I prefer the automatic, I am very positive that the m.o.i.v. has never yet proved its superiority in the case of twin or multi-cylinder motor cycle engines either for speed or reliability.

Looking carefully through many back numbers of *The Motor Cycle*, I find that, in 1906, on the occasion of the A.C.U. open hill-climb on Birdlip, that a (?) h.p. m.o.i.v. twin of 950 cc. was easily beaten in the unlimited class by a

5 h.p. twin of 670 cc. fitted with automatic valves. In the A.C.U. Six Days' Reliability Trials for the past few years all the special awards in the twin-cylinder class have been gained by machines fitted with automatic valves. The first open motor cycle race held at Brooklands this year was won by a twin-cylinder machine fitted with automatic valves, the Tourist Trophy twin-cylinder class both in 1907 and 1908 was won by a.o.i.v. machines, and I think, without question, in all open hill-climbs during the season of 1908, the twin-cylinder machines with automatic valves have invariably scored the fastest time, and it has been particularly noticeable in many instances that 5 h.p. machines with a.o.i.v. have beaten 6 and 8 h.p. m.o.i.v. multi-cylinder machines.

One gentleman mentioned, in the discussion which followed Mr. Cove's paper, that there was hardly a multi-cylinder car in use at the present time with automatic valves. Certainly, this comparison is ridiculous, as a car has plenty of room to carry, in a substantial manner, the extra mechanism required to operate mechanical inlet valves.

The only objection I have ever had to the automatic valve has been the bother of the spring cups and cotters causing wear, but this difficulty, I am very pleased to say, I have entirely overcome by fitting a screw cup on the valve stem with a lock nut, and this construction has been accepted and adopted by Messrs. Peugeot (see description of this valve in *The Motor Cycle* for November 25th, page 924), and will be fitted to all of their engines in the future. I have just heard that the De Dion Bouton Co., who have always been great believers in the automatic valve, have adopted this same construction.

Further, I can only say that, until such time as the m.o.i.v. twin-cylinder motor cycle engine is able to prove its superiority over an a.o.i.v. engine of equal cylinder capacity, devotees of the twins will do well to stick to the automatic inlet valve.

W. H. WELLS.

Stanley Show Impressions.

[3749.]—While being greatly struck by the ingenuity displayed in designing the new Quadrant engine, may I be allowed to add a few words of criticism and of correction to remarks which have appeared in your pages?

The flat-faced valves were used in the a.i.o.v. of the 1906 Vindec, F.N. engine, with what success I do not know, except that they are now used in no other engine on motor cycles, to my knowledge. The placing of valves fore and aft instead of at the side is an old idea revived; it was embodied on the twin Bercley engine (now defunct), whose cylinders were side by side in the manner of the 3½ h.p. twin Werner.

The fault with the one lever control carburetter is that, when once started on a ride and the shutter adjusted to suit the temperature, no means exist for enriching the mixture without closing the throttle, e.g., on a steep hill, when pace falls down slightly and it is necessary to close the air (i.e., enrich the mixture), it is necessary to close the throttle too, just when full gas is wanted; the same thing occurs when starting after a stop. The two alternatives are either to start throttled right down with air cut off, or to fiddle about with the tiny shutter, which on a hill is no easy task, and one very likely to seriously upset the mixture. Of course, on a car one lever will act well, as when pace is dropped the gear ratio is lowered and engine revolutions are kept up. It would be interesting to hear from riders who have tried this carburetter whether "one lever" (to say nothing of an air shutter and magneto lever) "gives a perfect mixture at all speeds and in all conditions of atmosphere."

EP 91.

EXPERIENCES WANTED.

"F.R.S." would like readers' experiences with the R.O.M. rubber-studded covers and bands.

"J.M.D." would like readers' opinions of speedometers on motor cycles after giving same a fair trial.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

The Simms British Magneto.

THE Simms is the second all-British high tension magneto, and the fourth new pattern magneto, we have had submitted to us for inspection during the last few weeks. It is a well-made

machine, weighing only 5 lbs. 8½ ozs. complete with driving sprocket, and stands 4 in. high. It is shown dissected in the two accompanying illustrations. As will be noticed, it embodies well tried features, but we have failed to find oil holes for lubricating the ball bearings at each end of the armature*. Double field magnets are screwed to the soft iron pole pieces P, between which the H type armature R rotates. The armature revolves on two ball bearings BB supported by the brass end plates T. The contact breaker is fitted on the end of the armature shaft, and, of course, revolves with it, a key and keyway ensuring its accurate replacement. The contact breaker is held secure by the centre screw F, so that it is an easy matter to remove it for cleaning purposes. This screw F also connects the insulated holder for the contact screw to a brass plate which is connected one end of the primary winding, the other end being connected to the armature core. The contact screw is adjustable, and the method of operating the

break of the platinum points K is by the fibre insertion of the bell crank J coming in contact each revolution with the steel segment C fixed inside the timing disc B. The flat spring L brings the points together again. The distance the platinum points separate can be noted while revolving the

armature, after removing the dustproof cover A held in position by the spring Q. A cover M enables the armature and condenser U (fig. 1) to be readily inspected, the catches N hold-

Fig. 2.—The Simms Single-cylinder Magneto. The letters are referred to in the description.

ing it in place. A switch wire may be attached to the terminal E if desired for short circuiting the magneto. It is mounted on, but insulated from, the timing disc B, and connected to the centre screw F by means of the spring D. The whole of the parts can be easily dismantled, and the armature can be taken out for inspection if necessary by removing one of the brass end plates T, which latter are held by three screws.

The timing disc B and the steel segment C can be rotated through an angle of 25° to vary the timing of the spark.

*The manufacturers have informed us since writing the above that the ball bearing on the driven side is packed with grease, which lasts for a year, and that the bearing on contact breaker side is oiled by means of a small oil tin after the cover has been removed. Two little oil drain holes not shown on the base plate are also provided.—Ed.

A RIGID SIDECAR IMPROVEMENT.

ONE objection to rigid sidecar attachments which has now been overcome was the method of fixing the attachment to the bicycle. This operation usually occupied a considerable time, and every time it was desired to use the bicycle solus it was no operation to disconnect the sidecar and replace the attachment in alignment with the bicycle. A purchaser was told that it "did not take many minutes," but for the steering to be accurate the fitting of a sidecar must be done carefully to get it in alignment with the bicycle. This applies to sidecars of the rigid type, but the Montgomery flexible

pattern sidecar has gained much favour by reason of its almost instantly detachable fittings. Once the connections on the bicycle are fixed in the right position it is unnecessary to disturb them, as the sidecar cross tubes telescope into the fixing tubes on the bicycle. This arrangement has now been adopted on the Regent rigid pattern sidecars, which are made by W. Montgomery and Co., and should be the means of quickly bringing this excellent type of attachment to the front. *En passant*, we hear that Mr. Montgomery will be in possession of new works in Coventry early in the New Year.

MOTOR BICYCLES FOR SALE.

1908 5 h.p. Roc, Peugeot engine, Bosch magneto, two speeds, clutch, spring forks; £40.—Skidmore, Swallownest, near Sheffield.

1909 MODELS.

All requiring a Motor Cycle for the 1909 season should call and inspect our grand selection of new and second-hand motor cycles. Most of the leading makes are represented.

As in previous years, we have decided to take any number of second-hand machines in part payment for new, as

**Triumphs,
F.N.'s,
Vindec,
Moto-Reves,
Douglas,
Rexes,
Bats,
Browns,**

**Motosacoche,
Nortons,
L.M.C.,
Humbers,
Rocs
Quadrants,
Fairys,
Etc.**

All who have a 1906 1907, or 1908 machine should get our terms of allowance. We have every intimation of a great season this coming year. Orders should therefore be placed early to secure delivery when required.

Good market value will be allowed for second-hand models, and offers will be made by post subject to their tallying to description given at sight.

Copies of testimonials on application.

XMAS BOXES. THE "RIP" HEADLAMP.

We are now in a position to offer our clients a further supply of the now famous headlamps, which we have recently been offering at such astounding prices.

As proof of the quality we are offering, we again state that they are—

- (1) Sent on three clear days' appro.
- (2) All brass (riveted).
- (3) Not soldered in any part.
- (4) Fitted with 4in. lens.

PRICE (motor cycle size) 16/11
" (tricar size), 5in. lens 22/6
Order Early and Save Delay.

TYRES.

The under-mentioned tyres are all guaranteed and genuine, and we are only offering them at a low price prior to stocktaking.

As we have only a few of each size, we cannot guarantee delivery unless ordered immediately.

CONTINENTAL.

26×2in. covers, beaded 14/- each.
26×2½in. " " 17/- "
28×2½in. " " 18/6 "
28×2½in. " " 20/- "
28×2½in. " wired 16/3 "

CONTINENTAL MODEL DE COURSE.

26×2½in. covers, beaded 29/- each.
26×2in. " " 27/6 "

SHAMROCKS.

26×2½in., rubber 'studded' 40/- each.

TUBE CARRIERS.

The "RIP" TUBE AND BELT CARRIERS still lead the way for a good substantial carrier, despite the fact that they have been copied by many makers; but remember, they are only copies. Note the low prices. Note the high quality.

Quality. " " "B"

Tube Carrier 7/6 4/6
Belt Carrier 8/6 5/6

The "A" qualities are lined in two colours, and are finished in a very superior manner.

Long Handle-bars, best quality, heavy gauge, 5/6.
Leather Toolbags, "A" quality 7/6, "B" 5/6.
Twin Trembler Coils, heavy contacts, 12/6.
Vim Rear Stands, 5/6.
Stanley Dermatine rin. Belting, 8ft. 6in. lengths, new, 11/8.

Treble Twist Horns. Absolutely the latest. Try one on three days' approval, and you will never regret the purchase. Only 6/8 each.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

A POINT TO POINT.

WHEN I say a point to point I mean it both ways. There was the East Devon Point to Point Race Meeting—that was far the less important of the two—and then there was a motor bicycle ride between points, one of which was London and the other Exeter. There were, of course, heaps of other points which cropped up by the wayside—in fact, the whole trip was punctuated with points of one kind or another. There were hares and flints, and logs and mud, and chickens and dust, and last, but not least, there were hills. Oh! and I must not forget the biggest point of all—it was a motor bicycle driving belt. We shall come to that all in good time, and when we *do* begin on it we shall be haunted by it right up to the end of the story. Well! It was like this. My brother—a soldier man quartered in Exeter—wanted me to leave my comfortable home in order to go and admire him performing in this point to point affair—of course, I mean the one where you go jumping in the most dangerous manner, over banks and hedges and things. I should just like to mention here that you can get up an awfully sporting point to point on the high road if you use a motor bicycle instead of a horse, and calculate that one terrier dog equals a five barred gate (closed), and that a chicken which has lost its head—I don't mean *really*; that happens just as you pass over it—is about as deadly as a bank with a concealed ditch on the landing side. However, I'm not getting on very fast.

Testing a New Motor Bicycle.

There was a double attraction to me about this Exeter visit. It meant the hospitality of a regimental mess at the other end, and it also provided just the

opportunity I had been waiting for ever since the Stanley Show of 1907 to make a thorough trial of an up-to-date motor bicycle with a spring frame and variable gear. This, of course, is where we begin to get near that belt, and also, incidentally, on to rather thin ice, because no one nowadays can say a good word for any motor car or cycle without other people nudging each other in the ribs and whispering, "Oh! He's in the trade," or "He's got an axe to grind." Before we go any further we might as well get this matter cleared up. I am *not* in the trade, nor have I any interest whatever in Zenith Motors, Ltd., who made the Zenette machine on which I had my run. Having said so much, I hope I shall be allowed to mete out praise and blame as I like.

I got away from North London about noon, and made my way out *via* Putney Bridge. It is always rather ticklish work manœuvring in thick traffic on a fairly powerful and absolutely strange machine, and the fact that I had not been on a motor bicycle more than once in the course of the past three years was not calculated to inspire confidence in the breasts of those pedestrians past whom I swooped in my somewhat erratic career round Regent's Park and in the region of the Marble Arch.

Getting Accustomed to the Levers.

However, later on I began to get used to the taps and wheels and things, and soon became so much at home that I could have gone darting in and out under the horses' heads like the boys who carry the papers. I say I *could* have done so—that is, I think *now* I could have, but, of course, I wasn't so futile as to try. As far as Kingston my ride was rather marred by the fact

A Point to Point.—

that I had not quite mastered the method of operating the adjustable inlet valve type of throttle; but when I reached open country and could experiment in comfort without the fear of being overborne by an irresponsible motor omnibus, things began to settle down, and the steady throb of the engine showed that the mysteries of "mixture" had been solved.

The first thing which really struck me was the extraordinary way in which the Zenette's double frame and four coil springs suspension absorbed the road vibration. In the old days I was obliged to give up a very rigid frame machine, because I found it upset my nerves, but really with a frame built on the Zenette principle even the most nervy would have nothing to complain of. To watch the two front springs, while the bicycle was travelling at twenty miles an hour, was quite an object-lesson in the way of showing how much vibration there was to be eliminated. These coils were incessantly quivering, yet the frame to which they gave support was as steady as a rock. The variable gear was hardly brought into operation much on the first day's run, which took me as far as Sutton Scotney, on the Basingstoke-Stockbridge road, but from that village onwards there were perpetually hills that would have absolutely defeated me had I been obliged to rely upon a single gear ratio.

Climbed All Hills Easily.

So efficient did this gear prove itself that I had no difficulty whatever in negotiating the long, steep Devonshire hills, though my engine was a Fafnir single-cylinder of only 80 mm. by 80 mm., and the machine was heavy. It is on this point of weight that I think the makers go wrong. They seem to suppose that heaviness does not matter provided that comforts are provided, and that the machine can go anywhere with a small engine. To some extent this argument is plausible, but it will not appeal to elderly riders or to the physically weak. As far as I can see, there is no reason why the double frame should not be built far lighter. Now enough about the machine, its good points and its bad.

The belt began to slip badly just before I reached Basingstoke, so I skipped off in a light-hearted manner and proceeded to screw up a nut, which, as I fancied, would do the needful adjustment. When I got on again the thing was worse than ever. Being hot and cross, I stopped at a shop and asked the proprietor's advice, for I was not acquainted with the ways of this particular belt. The man took out a link, and said it would now be all right. I got a mile down the road, when the belt broke. I put in one of my three spare links, muttering anathemas upon the idiot who had tightened the thing up too much. After this I reached Sutton Scotney in safety, and stayed the night here.

The next day's trip was 120 miles, so I got off early, at nine o'clock. Suffice it to say that the belt broke four times and slipped all the rest of the way. I reached Exeter at 6 p.m.

Next day in the intervals of point to pointing, I got some collan oil, and dressed that belt well. I also purchased twelve spare links, just in case any more broke.

On the morning after the races I made a move for home at 10 a.m. It had rained all the previous day, and it took me one hour and a quarter to reach Honiton

(sixteen miles). The road was exactly like a butter-slide. I have never *seen* a butterslide, but I suppose it is extremely slippery, and that was what the road was. All things considered, I was lucky to get along at all without a bad skid. From Honiton onwards the road improved, and the belt began again. It came off twice between Honiton and Chard. It broke once between Chard and Crewkerne, once between Sherborne and Shaftesbury, and twice more between Shaftesbury and Salisbury. As luck would have it, the thing behaved itself while I tackled Shaftesbury hill from the Sherborne side, and the machine came up splendidly. I reached Salisbury, after proving of considerable interest to persons who, I take it, were the village idiots—I was cross, of course, and may have misjudged them—at five o'clock. With twenty-three more miles to go I quite thought my troubles were practically over. As a matter of fact, it took me two hours to cover the distance. Twice the belt broke again, and then, just when I was ready to drop down and cry from annoyance and weariness, the expanding pulley jammed! It was the only thing, other than the belt, for which I was compelled to dismount, and the fault lay not in the pulley, but in me, who had omitted to oil it. Anyhow, I had to take the thing to bits by the roadside and then put it together again, and I *was* so tired.

More Belt Troubles.

Once more I put up for the night at Sutton Scotney, and was not sorry to seek an early bed. The last day of the run was not quite free from trouble. It started early, and went on often. Before breakfast I thought I would just get the engine running so that there might be no delay when I finally wished to make a start. I ran the machine three hundred yards down the road, when—the belt broke! In order to unscrew one of my spare links I had to file up the end of my screwdriver. It was only when, within three miles of my starting point after breakfast, the belt broke again, that I found I had left the file by the roadside. It took me twenty minutes and a large Hampshire flint (used as a file) to get the screwdriver to do its job. Then I got on to Basingstoke and sought the railway station. No train up to town for over an hour! I adjusted the belt again very carefully, and once more dressed it with collan oil. On again. The wretched thing broke at (1) Hartley Wintney, (2) Blackwater, and (3) Chertsey. That was the last of it, and I got home without more trouble. It's my belief that belt was possessed of two devils. One caused it to break if it was tightened; the other had the same effect on it if one loosened it. In the latter case it would turn over on its side and snap for the mere fun of the thing. I notice the dogs and chickens have not appeared very prominently in this narrative. There were lots of them, but there is no space left to tell of their evilness. Already I can hear the Editor's voice gloomily asking, "Surely this must be the end?" And my reply is, it is!

H. C. L.

Thomas Clayton and Son, Ltd., 125-126, New Street, Birmingham, have sent us a copy of their motor cyclists' chart. This gives distances to and from one hundred principal towns in the United Kingdom, as well as the index marks for all county councils and county boroughs in the kingdom. Any reader of *The Motor Cycle* can obtain a copy of the chart by sending 2d. for postage to the above address.

THE SIX HOURS WORLD'S RECORD BROKEN.

ON Tuesday, the 22nd inst., at Canning Town, O. C. Godfrey made a successful attempt to beat the six hours record, previously held by H. Martin. Godfrey's machine was the 5 h.p. twin-cylinder Rex which competed in the Tourist Trophy Race of 1907. It had the ordinary type of pistons, 24in. wheels, a $2\frac{1}{4}$ in. tyre on the rear wheel, and a 2in. tyre on the front. The tyres were Continentals. The gear ratio was $3\frac{1}{4}$ to 1, the belt was a Shamrock-Gloria, and the ignition was by Bosch magneto. At 9.50 a.m. the timekeeper, Mr. A. G. Reynolds, gave the word to go, and a few seconds after the machine dropped into a steady pace, from which it varied little during the rest of the long ride. At times lap after lap was covered at the rate of forty-eight miles an hour, or a lap in 25s.

A Fine Day.

The day turned out fine and sunny, but a cool westerly wind swept the track. Precautions were taken against the track being wet, as the machine was fitted with a front mudguard with leather extension. Throughout the run Godfrey, although he was on his first attempt at a record ride on the track, rode most consistently, and in this he was no doubt assisted by the Jones speedometer which was fitted to his machine. His stops were for the following causes: At 71 miles for petrol. At 110 miles to change the back wheel—a precaution necessitated by the tyre being worn on one side through contact with the surface of the track, since Canning Town track is somewhat hard on tyres,

on account of its small size (three laps to the mile), as against Brooklands almost three miles to the lap. Shortly after Godfrey again stopped, as he was under the impression that the back wheel nuts were not sufficiently tightly screwed up. At 140 and 206 miles he again took in petrol. At 215 miles he replaced the front exhaust valve spring, and 15 miles further the valve broke, necessitating a stop of five minutes, which included changing the back wheel, in the tyre of which a nail was observed. At 245 miles he again changed the back wheel, the tube of which had been repaired after the puncture. The tyres stood up well, and the engine ran with the utmost consistency until the valve spring was replaced. The new spring, however, was a trifle too weak, so slight misfiring ensued, but not enough to prevent several laps being reeled off in $24\frac{2}{5}$ s.

268 Miles 285 Yards in 6 Hours—World's Record.

The total distance covered in the six hours was 268 miles 285 yards, as against Martin's previous world's record on April 13th, 1908, which stood at 244 miles 1,650 yards. The following are the distances covered up to five hours: First hour, 46 miles 100 yards; second hour, 93 miles 1,200 yards; third hour, 139 miles 320 yards; fourth hour, 186 miles 1,300 yards; fifth hour, 228 miles 1,600 yards. Godfrey also broke all previous records after 101 miles. We are asked to state that Price's lubricating oil and Shell motor spirit were used by Godfrey in his record ride.

Quite the best accessory catalogue exclusively for motor cyclists has reached us from the Service Co., Ltd., 292-293, High Holborn, W.C. There are many catalogues published by the different accessory dealers, but they usually contain car and motor cycle accessories combined. This latest catalogue of the Service Co. illustrates only motor cycle parts or accessories, and it is, therefore, essentially a motor cyclists' guide.

All the items in the list are up to date articles in constant use on various types of machines, and are well arranged and illustrated, priced in plain figures, and there is an index in the front. The Service Co. have specialised on motor cycle clothing, and in the Service All-weather suit, the Dryknee jacket, the Thery costume, and the Gordon-Bennett coat they have a line of outer garments to suit all tastes.

A HOME-MADE PASSENGER MACHINE.

A NOVEL passenger motor cycle, designed and built by Mr. J. Warr, an amateur, of Archery Road, Leamington, is depicted in the illustration on this page.

The machine presents some sound, serviceable, features, and is speedy, light, and economical to run. It is not as wide as the ordinary tricar, which is an advantage for storage purposes. The 7 h.p. twin-cylinder Peugeot engine, fed by a B. and B. carburetter, is cooled as effectively as on a motor bicycle, and although on one occasion the low gear had to be used for a distance of eighteen miles, the engine did not become overheated.

The whole machine has been assembled by Mr. Warr with the most primitive of tools in his leisure time, and under adverse conditions.

The petrol tank is carried between the two tubes above the engine as in motor bicycle practice. The driver's seat swings back, and underneath is situated the oil tank, accumulator, and coil. Incidentally it will be observed that the wiring is very short. The back axle was taken off an old quad, and it is the adaptation of the axle and two-speed gear that is exceptionally praiseworthy. A chain runs from the engine to the counter-shaft, and on the latter are two free-wheels, a sliding dog in the middle locking one or the other to the shaft. The drive is transmitted from these wheels by chains to two wheels attached to the differential gear box on the back axle. To render the axle suitable for a chain drive the teeth of the old gear wheel and the brake drum were turned off. There is a big tool

box underneath the passenger's seat. A local contributor assures us that the performances of the machine would be a credit to any maker. It will attain a speed of 35 to 40 miles per hour on the flat, and will climb Sunrising and Newnham Hills in magnificent style, on the low gear of course.

The home-made three-wheeled passenger motor cycle referred to, which we are assured has proved quite satisfactory.

Mr. Warr said to our contributor: "In the trade there are some accomplished copyists, but my freak is original, and I claim nothing for it but that."

Mr. Warr was successful in obtaining a consolation prize in *The Motor Cycle* design competition four years ago for a design of a similar machine. The present tricycle is an improvement on the original design.

A NEW TYRE FOR MOTOR CYCLES.

THE Sirdar Rubber Co., 21, Crawford Street, Baker Street, W., have this year paid special attention to the manufacture of tyres for motor cycles. The two annexed illustrations show two types of covers specially constructed for powerful machines. Fig. 1 shows a non-skid cover. In this the studs project through a thin rubber covering A, beneath which there is a thick canvas backing B. Between this and the inner canvas D is a padding of soft rubber, which should render the tyre most resilient, and prevent it being damaged by puncturing agents. The grooved cover is also worthy of interest, as the tread A consists of hard durable rubber, while between this and the inner canvas C is a padding of soft rubber B. This idea strikes us as being an excellent one, and should tend to make Sirdar tyres most resilient. We have not at present tried these tyres, but from all appearances they show promise of being most successful. Two covers were shown at Olympia which, we understand, had been used on a motor cycle for 8,000 miles, and they were still in wonder-

fully good condition and fit to be retreaded, having been returned to the makers for that purpose.

HOW TO REMEDY FAULTS IN COILS.

By "RENDILE."

IN spite of the ever-increasing number of devotees to the newer magneto ignition for motor cycles, there are very many riders who, for various reasons, adhere to the older coil and battery ignition. The writer is one of the latter, and had the unfortunate experience of breakdown in a plain and also a trembler coil. The cause proved to be broken internal connections. Electricians advised me to "get a new coil, as undoubtedly the old one was played out," or words to that effect. Instead of adopting their

ends have been twisted together. Before connecting up it is advisable to cover every wire with rubber tubing. In any case, each wire should be well insulated, especially the secondary, which should always be well covered with rubber.

Now for the connections. These will be easily seen in the two diagrams showing a plain and trembler coil. Very often the internal wires are connected to the terminals from underneath; sufficient latitude in the lengths of these wires should be allowed for the purpose. When the connections are all made to the cover or terminals, a test of the coil should be made. Then, if found to be sound, the box should be filled with pure paraffin wax. This is almost colourless when solidified. This wax should only be melted by placing it in an earthenware vessel and then placing that vessel into hot water until the wax melts. After the wax is melted, keep down the heat until just sufficient to keep the wax in a liquid state. Pour in the melted wax to the level required, and arrange the connecting wires so that they will cross one another as seldom as possible. If some have to cross, put two or three thicknesses of thin paper, soaked in the wax, between the crossing wires. Every endeavour should be made to keep the secondary wire leading to the spark plug terminal quite apart from the others, even though it is rubber-covered. Having obtained a proper level of melted wax, screw down the cover

and leave the coil for a few hours to solidify, when, if the box has been properly filled, no amount of ordinary vibration will upset the interior. Any superfluous wax can be easily removed after cooling.

Faults in Ignition Coils.

It sometimes happens that a coil will buzz at the trembler well enough, but the spark will be intermittent or absent. The fault is either that: (a.) Internal connections are broken. (b.) Secondary winding is burnt out by use of too high a voltage battery; bad insulation in winding or wiring; insulation

advice, I opened the cases of the old coils, breaking more connections in the process. I repaired both the coils, and as a defective coil is no uncommon thing, I will give a short account as to how I executed repairs to my two coils.

Repairing a Plain Coil.

The plain one was set in a reddish-brown sealing wax, so after the cover had been removed the coil was placed on a tin plate smeared with grease, and placed in a gas cooking oven. The wax soon commenced to run on to the plate, and, owing to the grease, it did not stick to the tin. Water will answer the same purpose, provided that it is not allowed to evaporate too fast. The coil and condenser were then left exposed, and the superfluous pieces of wax removed with a warm knife.

The next thing was to reconnect the wires. Ignition coils consist of two windings of wire—one thick (called the primary), the other thin (secondary). These two are wound on a bobbin, through the middle of which is a bundle of soft iron wire. The two ends of the primary winding will be found near the centre of the bobbin. One of the ends of the secondary wire is nearer the outside of the bobbin; the other end is usually on the outside of the coil. The two condenser wires will be easily found. If any of the wires are broken off short, other pieces must be soldered on after the

Trembler Coil Internal Connections.

Secondary (2) to S.P. (terminal of box).

How to Remedy Faults in Coils.—

perished through age. (c.) Condenser is out of order. A good spark is usually of a bright blue colour; a spark of a red hue is usually the sign of something being wrong somewhere, most probably in the condenser itself. From practical experience, a reddish spark need not be considered at all fatal, as long as the spark is there when required, but when purchasing a new coil a blue spark should be sought after.

In each of the above cases it only requires a little trouble to take the coil apart, and the fault remedied either by an amateur (if only one of the connections is broken) or by an expert (if the condenser or secondary is faulty).

It is hardly necessary for me to assume that the reader will make certain that the outside connecting wires are unbroken, and that all the outside terminals on coil, battery, contact-breaker, and switch are clean and screwed up tightly, before he seeks a fault in the coil.

Supposing that the sparking has become faulty, the cause of the trouble should be sought for as follows: Test battery with voltmeter to see that current is up to efficient strength. If the battery has run down, a trembler will often stick. Examine points of trembler to see that they are clean and flat. Examine contact points on contact-breaker and see that contact is made

at correct moment. Examine connecting wires for breakages, and terminals to see that they are clean and firm.

To Test a Plain Coil off the Machine.

Connect positive (red) of battery to + terminal on coil, and negative (black) of battery to E (earth) on coil. Fasten a wire to C B on coil, and touch the S P terminal with the free end; a spark should result every time the S P terminal is touched.

Trembler Coil.

Connect positive of battery as in plain coil, and negative of battery to C B on coil. Fasten one end of another insulated wire to C B, and hold the free end one-sixteenth of an inch from S P terminal; a continuous spark should result.

In either case (plain or trembler coil) a sparking plug could be connected to the S P terminal of coil, and the metal or base of plug touched with the wire from C B. The plug should then spark between the points in the ordinary way.

It should be remembered that a wire leading from the S P terminal of coil is charged with high-tension current when a circuit is made; therefore not only must it be an insulated wire, but carefully handled as well, or a shock might result if any other metal part of machine or terminal is inadvertently touched.

M.O.I.V. FOR TWINS.

By B. H. DAVIES.

SOMETHING of a controversy is secretly raging on the merits of mechanically operated inlet valves for twin-cylinder motor bicycles, and one or two riders, possessing only experience of m.o.i.v. on single-cylinders, have been heard to assert that they will never purchase a twin-cylinder motor bicycle until they find one that strikes their fancy in other respects and employs mechanical inlets as a standard. Theoretically, I suppose the engineering ideal for motor cycle engines, as for motor car engines, is an inlet valve which shall employ a positive mechanical means of opening at slow speeds, and become automatic or suction operated when a high rate of revolutions per minute is attained, which theory points to a type of valve such as that fitted by the N.S.U. Motor Co. In the meantime, with the exception of such a combination as the N.S.U., we are left to choose between simple m.o.i.v. and a.o.i.v. Which shall we vote for?

In favour of the m.o.i.v. there is an impression that such engines are uniformly easier to start than a.o.i.v.—an impression my own experience fails to confirm. Two m.o.i.v. engines I have recently possessed have been on the average far more difficult to start than my a.o.i.v. twins ever are. Regular running at low speeds I have found equally possible with both types of valve, provided the carburation was right, and equally impossible with both if the carburation was wrong.

Turning to the a.o.i.v., we find this type of valve holds nearly all speed records. We find its alleged "sticking" when the engine is cold more or less of a myth, and that if it does occasionally stick up, it is instantly freed by means of the external spring pushers

supplied with all up-to-date a.o.i.v. engines. The sole indictment remaining against it is one that has been true in the past, but will not hold good in the future, namely, that it needs constant adjustment. An automatic inlet valve has to be light; consequently both cup and cotter have been found to wear very rapidly. You set the lift, or opening, as it is more strictly termed, of your automatic valve at, say, $\frac{3}{32}$ in. You drive for a certain number of miles, and you find the opening already fractionally increased, while in a thousand mile tour the cotters will wear so much that they have to be discarded by any stickler for efficiency. Also the drilling of the stem to provide a slot for the cotter causes these valves to snap off occasionally; whereas a mechanically operated inlet valve hardly ever breaks. These defects have been dodged on the latest types of inlet valve, and to satisfy one's self on this point it is only necessary to inspect such motors as a De Dion 'bus or a 1909 Vindec motor cycle. The inlet valve on these engines is no longer constructed with a sliding cap and a cotter that works in a slot. The stem is solid, and has a screw thread cut on it. The cap is internally threaded, and screws up and down the stem, so that the lift can be delicately adjusted without a supply of spare cotters being necessary, while a lock-nut takes the place of the old-fashioned cotter, and entirely prevents the cap from getting out of place. The idea is a revival of a system fitted some years ago to automatic valves and discarded on account of liability of breakage at the screw thread on the stem—a trouble that is apparently overcome, owing to the increased diameter of the stems. With such a valve as this the opening should not vary more than a fraction during 2,000 miles.

STARTING UNDER DIFFICULTIES.

I RECENTLY accompanied a friend who had just purchased a second-hand twin-cylinder motor bicycle, and who wished to exhibit its sterling qualities by riding out to the golf links, several miles away. It had neither pedals nor hand starting gear, and, knowing him to be not exactly an expert, I expected an amusing half-hour. The tank being brim full and the machine prepared as though for a long tour, he liberally soused the cylinders and induction pipe with paraffin and petrol, and commenced to run furiously with it down the street.

A series of alarming grunts from the machine ensued and an occasional explosion; something was evidently wrong. An additional half teacupful of petrol was poured down the induction pipe, and once more furious efforts were resumed, with no better results. The local repairer then came on the scene, and advised external heating of the cylinders. The machine was accordingly wheeled into the forge and a large brazing lamp brought to bear on the cylinders.

By this time a considerable crowd of interested spectators had gathered round, some armed with

buckets of sand in case of destruction by fire. The experiment was quite successful as regards heating the cylinders, and gave quite a businesslike aspect to the frame enamel. The bicycle was then hauled into the street again with feverish haste, lest the coveted head should be lost, and, having again administered copious draughts of petrol, the owner once more partook of violent exercise down the road.

Lo and behold! one cylinder fired for at least ten yards, only to strike work finally with a sulk snort. After repeated attempts with unvaried results the machine was again taken to the shop, and the carburetter, plugs, induction pipe, inlet valves, and magneto were dismantled, and subjected in turn to much abuse and a thorough cleaning. All gears having been replaced, the obstinate twin was again put through its paces without the least sign of starting. My friend was on the point of giving the matter up and consigning the bicycle to a place where the cylinders would never need heating, when I drew his attention to the fact that the petrol tap was tight and closed!

T. C.

DETACHABLE SIDECAR FITTINGS.

THE great advantage of quickly detachable sidecar fittings has over and over again been pointed out in these columns. They render a bicycle so easily convertible to a passenger machine that the owner of a motor bicycle and sidecar almost imagines he has two separate vehicles. Moreover, the difficulty of storing a three or four-wheeled machine is rendered *non est*.

Instantly detachable fittings were not used this year on rigid pattern sidecars, but the want was apparent

to Mr. W. Williams, a North London motor cyclist, and he designed the fittings we illustrate, and had the parts made by Chater-Lea, Ltd. Thinking the idea will be useful to some of our readers, he sends the sketches for reproduction. The fittings are shown for attachment to the right side chain stay of a motor bicycle, but could easily be adapted for the left side. Mr. Williams used his rigid sidecar with the fittings illustrated all last summer in connection with his twin-cylinder Minerva. The sidecar can be attached or detached in five minutes, the total work involved being the withdrawal of three bolts and the slackening of a fourth.

The attachment is an ordinary Chater-Lea with the usual telescopic attachment at the front, and a strut from seat lug of bicycle to the extreme outside of

sidecar. The piece A is left permanently on the chain stay of the bicycle. Bolt H is withdrawn, the sole piece B inserted into A, and the bolt H replaced. Piece B has a telescopic adjustment into C, which never moved after once being set. Care must be taken that the piece A is set at right angles to the centre line of the bicycle, and not at right angles to the chain stay, otherwise A will be distorted away from B and it will be impossible to connect up.

An important point not considered by many sidecar users is that some motor bicycle chain stays are too light for attaching a sidecar, and spring a good deal. In a case of this kind it is a wise precaution to suitably strengthen the chain stay of the bicycle by brazing on a piece of metal where clip D is fastened.

A useful hint to facilitate the building up is to place underneath the sidecar wheel a block of wood equivalent to the height of the back tyre above the ground when the bicycle is on the stand.

Messrs. Dunn and King, Ltd., wire rope manufacturers, Carronbridge Works, Larbert, Stirlingshire, have lately placed on the market some flexible steel wire, which motor cyclists will find to be of the greatest service in controlling brakes, throttles, air inlets, etc., on their machines. This wire possesses the advantage of being made in a special apparatus and the finished strands are turned out so that each individual wire takes its full share of the load. With many of the wires sold and used for motor work, some of the strands do not take up their share of the strain at the moment the others do, and in consequence, when the brake is suddenly applied, one or two of the strands take up the load, and, their strength being inadequate, they snap and in most cases fray. Another point in connection with the wire under consideration is that it may be had specially tinned, which is an undoubted advantage. In the first place, tinning protects the wire to a certain extent from rust, and, in the second place, it can be cut without fear of the strands fraying out.

A Metal-to-metal Disc Clutch.

AN article which has been mentioned several times in the columns of *The Motor Cycle* both in "Letters to the Editor" and in descriptions of trials held during the closing year is the Mabon free-engine pulley and metal-to-metal disc clutch. Under the circumstances a description and illustration of this very popular device will be of interest to our readers.

It will be seen on reference to the illustrations that the clutch is carried in the box A, and consists of a number of steel discs held in frictional contact by a coil spring

The pulley is, of course, free on the engine-shaft when the clutch is entirely withdrawn by the forked lever C, which is operated by a Bowden wire D connected to a Bowden lever on the handle-bar of the motor cycle. This lever on the handle-bar is provided with a stop, which holds the lever C in such a position that the clutch is entirely released and the pulley remains stationary, while the engine is started by means of a handle, which can be attached to the main shaft of the engine at E. The bracket F on which the lever C works is held to the crank chamber of the engine by one of the crank case bolts; usually the top forward bolt is found the most

suitable. When ordering the clutch, the distance should be given between the centre of the bolt hole and the centre of the engine-shaft.

The Mabon Clutch, showing clutch fork and attachment for Bowden cable fixed to one of the crank chamber bolts.

We went to Finchley recently to see Mr. Mabon, and had a short run on his sidecar, which was fitted with his latest pattern clutch. By means of the latter the combination started with ease from a standstill on the level. The engine is about $3\frac{1}{4}$ h.p., and it took up the drive without any appreciable effort. On Barnet Hill the engine took us up without a touch of the pedals, but the clutch required slipping a great deal, as we were hampered by heavy traffic.

When climbing hills and the engine shows signs of slowing down or knocking, a very light pressure on the lever on the handle-bar is sufficient to partly withdraw the plate clutch and cause the engine to accelerate. The clutch is oiled with cylinder oil.

The average weight of the device is about 6 lbs., and it can be fitted to any motor cycle engine if the boss on the crank case does not exceed $2\frac{1}{8}$ in. in diameter. The pulley is adjustable, with flanges 5 in. in diameter, which can be set to give a gear of 4 to 1, and intermediate gears down to $5\frac{1}{2}$ to 1.

The pedalling gear can be retained if desired, the left crank being set out to enable it to pass the end of the clutch.

PETER UNION TYRES FOR 1909.

THE former models of the productions of the Peter Union Tyre Co., Ltd., remain practically unaltered for next year, but an innovation has been introduced in the shape of an excel-

lent non-skid which is here illustrated. It will be seen, on referring to the illustration, that the studs project through chrome leather, which is backed by a canvas lining. Between this lining and the canvas proper of the tyre there is a fair thickness of rubber. A glance at the illustration will show how strongly the walls of this tyre are constructed. Peter Union tyres were most successful in 1908, and were employed by some of the successful competitors in the London to Edinburgh, Land's End to John-o'-Groat's, and other important events.

A. - Chrome leather
B. Canvas lining.

We have received from Tesama, Ltd., 6, Major Street, Manchester, a sample of their puncture proof cover for motor cycles. The sample submitted to us for inspection has been used on a motor cycle for 1,000 miles over the roughest roads around Manchester. The puncture proof device consists of a patent steel woven section which is inserted between the layers of canvas which form the casing of the cover. The makers claim that it is impossible to puncture one of these covers provided the tyre is properly inflated, and they also state that they are quite willing to let anybody strew nails and glass on a road and ride over them with properly inflated tyres, and if the tyres puncture to withdraw their claim on condition that if the tyres do not puncture they are taken over by the one making the experiment.

A New Eisemann Magneto.

THE Eisemann motor cycle magneto made its bow to the British public as long ago as 1902. It was then of the low tension type with a separate coil to transform the low to a high tension current, but the latest model of this make is a self-contained high tension magneto. The machine is exceedingly neatly and simply made on up to date lines, and is splendidly finished. The type submitted to us, which is for single-cylinder engines, weighs 6 lbs. 5 ozs., and measures $4\frac{5}{16}$ in. high and $5\frac{3}{8}$ wide overall.

Special attention has been paid to the lubrication of the new Eisemann magneto, which can be well understood, as the makers are prepared to guarantee that it

The complete motor cycle magneto for single-cylinder engines.

will successfully fire an engine at 4,000 revolutions a minute. The bearing on the driven end of the armature is plain, while the one at the opposite end is of the ball type. The plain bearing is fed by a wick lubricator, the end plate being hollow and forming an

oil reservoir, the oil being conveyed by capillary attraction through the wick. The oil holes are very accessible, and dust is excluded from them by means of spring clips.

Turning to the larger half-tone illustration, the double magnets B are mounted on a brass bed plate, and the pole pieces A, fixed to the horseshoe, form a tunnel for the armature. The armature is of the usual H type, carrying both the primary and secondary windings C. D is the collector ring for the high tension wire terminal and carbon pencil E. The pin S is a fixture on the cover which is screwed down over the armature, and, coming in close proximity to the collector ring, provides a safety spark gap. The circular condenser F is mounted on the armature shaft immediately behind the end plate M.

The contact breaker is simple and well proportioned. To observe the working of the magneto, the dustproof cover L is removed, after pushing aside the spring shown. This reveals the steel cam G mounted inside the timing disc H, the red fibre block P on the end of the bell crank O coming into contact with the cam once during each revolution, and thus causing the two platinum points to break contact. N is a flat spring working against the action of the cam. A stop to prevent the platina from separating more than a certain distance will be observed on the contact breaker disc. Both of the platinum points are adjustable by means of $\frac{1}{4}$ in. nuts, the contact screw R having a lock nut. The contact breaker can be removed bodily by taking out the centre screw Q, a stud at the back of the plate, and a corresponding recess in the armature shaft, ensuring its accurate replacement. A switch can be used if desired in connection with this magneto, the wire from the handle-bar being attached to the terminal K insulated from the timing disc but connected to the flat spring J which is in contact with the centre screw. The high tension and switch terminals are of special construction and of the snap-on type. A line section of the terminal appeared in *The Motor Cycle* of August 5th, page 607. The sole agents for the Eisemann magneto in this country are the United Motor Industries, Ltd., 46, Poland Street, W.

Fundamental parts of the new pattern Eisemann High Tension Motor Cycle Magneto.

Occasional Comments

By Ixion

A New Exhaust Valve Lifter.

"H. S. C." sends me details of a new valve lifting device he has invented, which is arranged to only hold the valve up on the compression and exhaust strokes, *i.e.*, the *upward* strokes of the piston, allowing it to close just as if the engine was working on the suction and firing strokes, *i.e.*, the *downward* strokes of the piston. He claims as special advantages of his method that the cylinder is kept full of fresh gas, so that the engine will invariably start the instant the valve is dropped, that thus there is no need to have the throttle full open at starting, and so a slow start is possible, and that the engine is very rapidly cooled when coasting, as cold gas is sucked in, whereas with the ordinary system hot air is drawn in via the hot exhaust pipe and silencer. It is at once evident that this new valve lifter would increase the petrol consumption, as the suction of the down strokes could be entirely concentrated on the carburetter jet, and I do not think the alleged advantages are sufficient to compensate for the waste of fuel. Any good modern machine will cool with the standard valve lifter and start on half throttle. If it is so far out of order that it runs hot and is difficult to start, I do not think the new valve lifter will overcome existing derangements.

Motor Tricycles.

No doubt the chief reason for the disappearance of the two wheels astern type of tricycle has been that new riders have storage for them. A rider recently wrote to me to know if any were still being made, and I had to reply in the negative. If such isolated individuals contemplate building tricycles for themselves I should advise them to proceed, as this type of motor cycle is simply ideal for winter work, particularly with a two-speed gear. It is absolutely immune from side-slip, and, though the steering is diametrically different from that of a bicycle, when once the rider is at home on it, there is no limit of speed so far as safety is concerned. All the tricycles marketed in this pattern have suffered from one grievous fault—wrong distribution of weight. As a rule all the weight was thrown on the rear wheels, and as the wheelbase was excessively stumpy the vibration over rough roads was extraordinary. I saw a specially built tricycle about 1902 with a long wheelbase, within which all the weight was carried, and it made so comfortable a bad weather mount that I had a duplicate built for my own use. A tricycle could be built in modern line; with a powerful engine, chain or belt drive, really good brakes, magneto ignition, handlebar control, and so forth, which would be simply ideal as an all-weather mount for a business man.

Tricar Gear Boxes.

There has been a lot of ink slinging lately on the question of tricar gear boxes, some writers clamouring

for three speeds and reverse, others asserting that everyone will be content with two speeds forward, dispensing with the reverse altogether. It is surely a matter of price. The desire of the two-speed enthusiasts is to cheapen the tricar, and it is obvious that a belt or chain drive with a two-speeded epicyclic gear and self-contained clutch will work out at a lower cost than a transmission consisting of a separate clutch, separate counter-shaft, two chains, and a three-speed and reverse gear box. The question will be settled by the industry, and their answer will depend on the price at which they decide they can expect a brisk demand. In the meantime, it is instructive to notice that the year 1908 has only produced two new tricars—the 5 h.p. Rex and the 5 h.p. A.C.—and that both of these are supplied with two-speeded epicyclic gear boxes. I would further remind the three-speed party that, while an intermediate speed is essential to comfort and efficiency on a 5 cwt. or 6 cwt. tricar, a light air cooled vehicle scaling only 3 cwt. can very well dispense with the extra ratio.

Exhaust Whistles.

I have long been sighing for a more effective and not less gentlemanly noise producer than the average hooter, especially with a view to waking up drowsy carters in country lanes, and I believe I have found what I sought in the shape of an exhaust whistle. I have so far only used one a very few miles, but it has proved very handy on all those occasions when one has a right to a clear road, but is unable with a mere hooter to warn the unconscious obstructors of one's approach. It carries a long way, and at the same time it does not make either an excessive or an objectionable noise.

The Crowsley system of springing a sidecar wheel has already been dealt with in these pages, but a word or two on its behaviour on the road will doubtless be of interest. On a recent morning the inventor, Mr. E. A. Crowsley, brought a sidecar round to Tudor Street fitted with the device under consideration. During a short drive over rough roads we found the riding to be decidedly comfortable, and undoubtedly infinitely more so than is the case with an unsprung sidecar. We regard Mr. Crowsley's invention to be of a thoroughly practical nature, and one which will help to popularise the sidecar further. It has been taken up by, and may now be purchased from, the Chater-Lea Mfg. Co., Golden Lane, E.C.

THE NEW PENNY EDITION OF "THE AUTOCAR."

Readers of "The Motor Cycle" who are interested in motor cars are reminded of the new Penny Edition of "The Autocar," now obtainable of all Newsagents and Booksellers every Friday Morning.

Questions and Replies

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E. C., and whether intended for publication or not must be accompanied with a stamped addressed envelope for reply.

Interested in Speedometers.

Will you kindly recommend me a good speedometer for my new Triumph motor cycle? I am a constant reader of *The Motor Cycle*, but have not yet found anything in it to suit me. If possible, I should like to pay about 3 3s.—E.A.C.

I recommend the following speedometers: The "Jones," sold by Markt Co., 6, City Road, E.C.; the "Covey," sold by the Cowey Engineering Co., 1, Albemarle Street, Piccadilly, W.; and the "Bullard," sold by W. Gamage, Ltd., Holborn, E.C.

Air or Water-cooled Engine.

I am in doubt whether to buy a 6 h.p. water-cooled Litette or a 5.6 h.p. air-cooled Triette of the latest pattern. Which do you advise, and why?—F.M., London, E.C.

If you intend to use the tricar in a district which will necessitate the low gear being used frequently and for long stretches, also if you intend to drive the tricar a good deal in London traffic, which will necessitate many stops and starts, we should recommend you to have a water-cooled engine. On the other hand, if you and your passenger are of light weight, and you want a machine as light and simple as you can get, the air-cooled engine would suit you well. The latter would, however, require more careful driving to keep the engine cool.

Timing the Spark.

I have a 3½ h.p. 1908 Rex, the makers of which advise the magneto to be set in one position, and the makers of the magneto advise it to be set in another. The Bosch Co. advise as per their catalogue, the maximum retard of magneto timing lever with engine at top of compression stroke, the break of the contacts about to set in. The Rex advise, as per their catalogue, the mean position of magneto timing lever, with engine on top of compression stroke, the break of the contacts about to set in. Will you please give me your advice on the matter?—H.G.

What the Bosch people have advised you is perfectly correct, as it is a golden rule to observe in timing a magneto. On the other hand, you must bear in mind that each engine has its own individual peculiarities, and the method of timing the magneto suggested by the Rex Co. may be most suitable for your engine. The obvious way out of the difficulty is to try and see from which position you get the best results.

Inlet Valve Springs and Hill-climbing.

(1.) My front inlet valve of N.S.U. is a great deal weaker than the back one. I have been told that it is right on account of it being a great deal further away from the carburettor than the back one. Is that correct? (2.) It climbs very badly; in fact, will not take a stiff gradient. The petrol supply is all right. The engine does not knock, but gradually falls off in power. What is the reason? Compression fairly good.—H.M.

(1.) Both inlet valves should have springs of the same tension and a rather small lift. (2.) Your trouble sounds like poor compression, and we should also say that the valve springs have lost some of their tension. Try new springs, carrying the old ones as spares. You might also try a lower gear.

The new inter-club team competition challenge cup, presented to the Motor Cycling Club by "The Motor Cycle."

Exhaust Valve Burning and Belt Slipping.

(1.) I have a 3½ h.p. Bat, M.M.C. engine. The exhaust valve burns away and has to be replaced every 250 or 300 miles. I do not drive very fast, averaging eighteen to twenty miles per hour. I keep the throttle closed as nearly as possible. (2.) What belt and pulley do you recommend? I have used canvas and leather belts; both everlastingly slip and wear out in a few hundred miles. I have changed my pulley without benefit.—B.P.R.

(1.) Perhaps the burning of the exhaust valve is due to a restricted area for the exhaust port or insufficient lift. Probably a special valve, such as that made by Arthur E. Heckford, Birmingham Metal Works, Birmingham, might overcome the difficulty. (2.) The belt trouble is probably due to using belts of too small a section. Both kinds will not slip at all if you see that both pulleys have the correct angle of 28°, and you use a good wide belt of the same angle.

Oil Leaking Out of Engine.

I recently purchased a three year old motor bicycle. Machine runs very well and regularly, but after a few miles the crankcase is covered in oil, and a recent run to Cambridge and back left it and the surrounding parts of the frame in an oily condition. The oil seems to ooze from around the bottom of the valves and the joints of the crankcase. This renders cleaning a tremendous task, and I wish to know if I can remedy it without taking the engine down by packing with brown paper, as being a novice I do not wish to interfere with it. Compression is excellent. I weigh eleven stones (approximately), the gear of machine is about 5 to 1, and on the ride mentioned I started with two pumpfuls of oil and subsequently injected four. The remaining oil drips out (not in a continuous stream) when drain stopper is unscrewed. Can you say whether the lubrication was correct? The engine gave no sign to the contrary.—E.J., Stoke Newington.

The trouble is probably due to the engine being rather worn, especially round the valve tappet guides. The only way to cure the trouble is to have the engine thoroughly overhauled and all defective bearings replaced, and new packing for the crankcase joints. We also fancy you are using oil which is too thin. Use only special oil for air-cooled engines. The quantity you give the engine seems to be about right.

Signs of Weak Magnets.

[?] What indication does a magneto give when it becomes weak and requires re-magnetising? Is there any test beyond using the small key that is placed on the high tension terminal? Does a magneto improve by being out of use? My own impression is that something of the kind takes place by getting very vigorous starting results from an engine that had been laid up during the winter of last year and untouched during that time.—R.G.L.

Apply the usual test. If you do not get a spark by turning over the magneto with the finger and thumb you will know that the magnets are probably demagnetised. You can also feel, to a certain extent, whether or not the pull of the magnets is strong. Failure to start on a strong mixture is also a sign. No, we do not see why magnetos should improve by being out of use.

Opening of Inlet Valves. Carbon Deposits.

[?] (1.) Can you say whether reducing the lift of an automatic inlet valve which now opens about 3-16in. to 1/4in. would give more power to engine?

(2.) When does the amount of carbon deposit on the piston demand removal? Is 1-16in. of carbon an excessive or a moderate amount? Would this much affect the running of an engine?—W.B.

(1) Reducing the lift of the inlet valve will often improve the running of the engine and cause the valve to wear better. (2.) Engines vary a good deal in this respect. An engine with a high compression will not stand much carbon deposit, as naturally the compression space is still further reduced. The surest signs of the engine requiring to be cleaned out is overheating and excessive knocking on hills, and failure to stop after switching off.

Shortage of Petrol.

[?] I have a 3 h.p. Triumph, 1905 model, fitted with Voltoo two-volt ignition, and I found that when climbing Hindhead Hill a few days ago with the throttle wide open the engine power gradually fell off, till finally it stopped. At first I thought it must be due to overheating, but I felt the cylinder and it was only hand warm; there was plenty of oil in crankcase. I went on again, and about a quarter of a mile further on the same thing happened. Is this due to carburetter level not keeping constant?—LC 4287.

We are inclined to think that the petrol pipe is stopped up, or the passage between the union of carburetter and the jet. If you thoroughly clean these parts and also remove the jet and clean it, it is unlikely you will be troubled again. Always use a funnel with a strainer when filling the petrol tank, as this prevents impurities from entering the tank with the petrol.

Oil-tight Joint between Cylinder and Crankcase.

[?] Please tell me of a really efficient material for packing the joint between cylinder and crankcase. I have tried card soaked in boiled linseed oil, and also brown paper smeared with secoco-

tine, both of which allowed the oil to leak badly. The joint may not be too good a fit.—P 3507.

Brown paper soaked in boiled linseed oil usually makes a good joint between cylinder and crankcase. The brown paper should be fairly thick, and free from all bits or lumps which would be likely to cause an uneven joint, and might cause you to break the lugs off the cylinder if you tighten the nuts unequally. If a sheet of first quality brown paper soaked in boiled linseed oil will not make an oiltight joint, you must have the bottom of the cylinder turned true and the top of the crank chamber machined true before inserting the packing. If the top of the crankcase and the base of the cylinder are machined perfectly true, an oiltight joint is obtained without the use of any packing.

Strength of Motor Cycle Belts.

[?] Can you tell me the breaking strain of a leather or rubber belt as used on a 5 h.p. motor cycle?—LN 3980.

We have enquired of two prominent belt manufacturers. The firm of leather belt manufacturers reply as follows: "We regret we are unable, at the moment, to give you the information you desire. We may, however, say that on the basis of belt speed of approximately 15,500 feet per minute the strain on the belt when transmitting 5 h.p. would not exceed 1 cwt., for which a lin. strong leather belt would be by no means an excessive load, and would not even approach the breaking strain." A further enquiry of a well-known manufacturer of rubber belts elicited the reply that they were not prepared to disclose the information desired. We think, however, you may take it that most belt manufacturers allow ample margin of safety.

Lubricating a Hub Gear.

[?] Kindly tell me how to lubricate the back wheel bearings of a 5 h.p. twin Vindex with two-speed gear? There is a lubricating place in the hub above the gear, but I can never succeed in getting any oil into it. I think it was originally packed with grease, but I have never lubricated the back wheel since I got the machine over a year ago. I have tried several times, but the oil only pours out as fast as it is put in. I am afraid of doing the bearings damage through want of lubrication.—MAJOR R., India.

The best way to get the oil into the gear is as follows: Obtain a piece of bent copper wire, heat it, and insert it in the hole. This will melt away any grease in the way, and you can then inject oil or grease. This should be put in with a force feed oil gun, after the latter has been thoroughly heated up, so that the oil or grease is as liquid as possible.

READERS' REPLIES.**Pitting of Contact Points.**

With reference to "H.K.'s" enquiry in *The Motor Cycle* of December 9th, I had the same trouble (as I thought) with the pitting of contact points. In fact, I went to the trouble of having

the coil overhauled twice and had new platinum points fitted, and still there was no improvement, so I turned my attention to the carburetter. After running two or three miles my machine stopped firing. I turned the petrol tap off and took the float chamber top off and found that the float chamber was empty (or nearly so). The trouble was that the float chamber did not fill fast enough. I made the hole in which needle fits just a shade larger, and have never been troubled with misfiring since, and can run a hundred miles to a gallon of petrol. I find the points pit just as badly on my machine now, but they do not affect the firing in the least. I use the same ignition as "H.K." on a 2 3/4 h.p. Minerva.—J. T. LEE.

Irregular Firing.

In reply to the query by the "Rev. W." in *The Motor Cycle* of 16th inst. re irregular firing, the small ignition pinion on a Motosacoche is a driving fit, not keyed, and in all probability has worked loose and slipped round, thereby interfering with the timing. I would therefore advise your correspondent to test the timing, or if he lives near here (Gloucester) I shall be pleased to put it in proper order for him.—W. B. GIBB.

Re the "Rev. W.'s" query in *The Motor Cycle* of the 16th inst. I think he will find his trouble caused by the stretching of the Bowden wire controlling the contact breaker and exhaust, consequent on the continual and severe strain put upon the said wire every time the exhaust is lifted. As the wire lengthens the clock spring carries the contact breaker farther back, so that when he now fully advances the spark (or rather thinks he does by the position of the hand lever) it is only actually in the same position as it would be with the lever retarded when the wire was new and unstretched. Might I suggest that he should try shortening the stranded wire (not the outer spiral sheath) a little.—S. R. HORFORD.

Books for . . . Motor Cyclists

Motor Cycles & How to Manage Them.

Price 1/2, post free. 12th edition.

Entirely rewritten and brought right up to date. Useful alike to expert and novice. The whole of the information given is applicable to any of the leading makes of motor cycles on the market.

Hints & Tips for Motor Cyclists.

Price 1/2, post free.

Reprinted from *The Motor Cycle*, and now issued in book form for the first time. Contains information of much value to all motor cyclists.

"The Autocar" Folding Map of England and Wales

Price 8/10, post free.

A real necessity when on a tour. It is well printed on linen, and folds up into a neat and strong case, 7 1/2 x 9 1/2 in. An indispensable motor cyclists' companion.

A full list sent on receipt of postcard.

Motor Cycle Races at Brooklands.

From a list of new regulations concerning the use of the Brooklands Track, we gather that motor cycle races are to be revived next year.

B.A.R.C. Appointment.

We are advised by the secretary of the Brooklands Automobile Racing Club, Carlton House, Regent Street, S.W., that Major F. Lindsay Lloyd, late Royal Engineers, has been appointed manager and clerk of the course, and that his duties commenced on Tuesday, December 22nd.

Manchester Motor Show.

We are pleased to inform our readers in Manchester and district that a large display of motor cycles will be included in the Manchester Motor Show. Among the firms who will exhibit motor cycles direct are Zenith Motors, Ltd., London; Humber, Ltd., Coventry; H. Reed and Co., Manchester (the Dot); and Bradbury and Co., Ltd., Oldham. B.S.U. motor cycles will be exhibited by the Northern Supply Co., Manchester; Browns by F. Bullock, Manchester; Rex by J. J. Looker and Co., Manchester; Midget Bicers and Corah light-weights by Lund and Sergeant, Stockport; and several different makes of motor cycles by J. W. Gourlay, Fallowfield. The exhibition opens on February 19th, and closes on February 27th next.

Further particulars regarding space, etc., can be obtained from the secretary, J. H. Wightman, Palatine Hotel, Victoria Street, Manchester.

Competitions at Brooklands in 1909.

In addition to the regular race meetings on Bank Holidays and other days to be announced later, open to all comers, it is intended to hold one or more club meetings, when contests for ordinary touring vehicles, hill-climbing tests, and handicap races will be arranged for the cars and motor cycles of members only. It is also proposed to hold meetings of county and other clubs, at which members of the B.A.R.C. can be present. Private races can be arranged at any time by application to the London offices of the B.A.R.C.

Privileges of Membership.

The annual subscription to the B.A.R.C. is five guineas, and the committee announces that members wearing their badges, or ladies wearing the rooches (of which two are furnished to each member) now have the following privileges:

(a.) Free use of the motor course upon all days when it is open to the public for use upon payment.

(b.) Free admission to the club enclosure and all parts of the grounds at all meetings.

(c.) Free admission to the members' enclosure at all meetings.

Every facility and assistance will be given to members wishing to initiate gymkhanas or other social meetings.

Members wishing to learn to drive may do so on the "finishing straight" on any days when the track is open to the public.

The management is devoting much

1909 Programme of the Auto Cycle Union.

January 20th (Wednesday), quarterly trials; April 24th (Saturday), quarterly trials; May 15th (Saturday), hill-climb; June 5th (Saturday), penalty run (probably in South of England); June 12th (Saturday), twenty-four hours' run; July 5th to 10th, six days' trial; August 21st (Saturday), annual race meeting (provisional); September (during), Tourist Trophy Race (provisional); October 6th (Wednesday), quarterly trial.

Be Wise in Time.

Through the courtesy of a Liscard reader we notice that the head constable of Liverpool has issued a public notice to all drivers and owners of motor vehicles pointing out that complaints received by the police suggest that the speed of motor vehicles within the city is increasing. A warning of this nature shows that the Liverpool police are desirous of treating motorists with some consideration, therefore their timely hint should be carefully taken. Unless motorists themselves keep the speed of their vehicles within reasonable limits, timing methods will be adopted in Liverpool, and other steps taken for the prosecution of reckless drivers. Readers are also reminded of the speed limit of twelve miles an hour in force in Sefton Park.

Motor Cyclists Indispensable.

Brigadier-General Sir Henry Rawlinson, Bart., presided over a meeting dealing with the cycle in warfare at the Royal United Service Institution a few days ago, at which Capt. A. H. Trapmann, adjutant of the 25th Battalion County of London Regiment (Cyclists) stated that motor cycles were absolutely indispensable for the carrying of despatches from one body of cyclists to the other. These were useful, also, in signal communication, and there should be twenty at least attached to each cyclist battalion.

Motor Cycle Thefts Increasing.

On a recent occasion, during the course of a trial run, a motor cycle was stolen from the Excel Motor Garage, 140, Camden Road, N.W. The following is a description of the machine: Chater Lea frame, narrow, long and jointed handle-bars, 26in. wheels, rubber pedals, back-peddalling brake, trembler coil, and condenser fastened to frame, registered number LC 4006. Fafnir engine with top fin broken, tyres Macintosh front and Clincher back, frame enamelled black.

FUTURE EVENTS.

- Jan. 7—(Provisional) Essex M.C. Paper by Mr. H. M. Wyatt on "Magnetos."
 " 7—"Motor Cycle Lamps," a paper to be read before the Auto Cycle Union, by Mr. P. W. Bischoff.
 " 20—Auto Cycle Union Quarterly Trial.
 " 16-23—Motor Cycle Show at Madison Square Garden, New York.
 " 23—Essex M.C. Annual Dinner.
 " 23—Coventry M.C. Annual Dinner and Presentation of Prizes.
 " 30—Auto Cycle Union Annual Dinner, preceded by the Council Meeting, at the Waldorf Hotel, Aldwych, W.C.
 Feb. 19-27—Manchester Motor Show.

attention to the catering arrangements for the coming season, and every care will be taken to provide suitably in this direction.

M.U. Foreign Touring Facilities.

A motor cyclist writing from Co. Antrim to the Motor Union states that his chief reasons for joining would be for the Continental touring facilities, and he asks whether any extra charge would be made for suggesting tours, advice as to routes, etc. The reply is that no charge is made for services thus rendered, and that the Motor Union's foreign touring facilities are of a character that cannot be surpassed. These facilities are available for motorists, whether travelling with their machines or not. The Union's membership of the Ligue Internationale des Associations Touristes gives it unequalled opportunities for catering for the tourist in every European country. It is of interest to note that this organisation is to hold its annual congress in London next July, the business sittings being followed by visits to Oxford, Leamington, Stratford-on-Avon, Cheltenham, the Wye Valley, and Swansea.

CLUB NEWS.

Brighton and District M.C.C.

At a meeting of the above club on Thursday, the 17th inst., it was decided to hold the first annual dinner and prize distribution on Wednesday, January 20th. The time and place will be notified shortly. All members are requested to attend this event, and also non-members who are motor cyclists will be welcome. Tickets for dinner 3s. 6d. A whist drive and billiard handicap will take place a fortnight later.

Liverpool M.C.

On Wednesday, the 16th inst., the annual dinner was held at St. George's Restaurant, the chair being taken by Mr. T. Clarke (captain). About forty members and friends sat down to dinner. A letter of regret was read from the president (Col. W. Hall Walker, M.P.), who was unable to be present, being out of town. During the evening the usual toasts were given, and the prizes won in the various competitions held during the year were handed over to the successful riders. The programme which had been arranged proved a very enjoyable one, the artistes sparing no effort to make the evening a very pleasant one.

Hartlepool and District M.C.C.

The above club held a very successful whist drive and dance in the Grand Hotel, West Hartlepool, on December 9th, 170 persons taking part. After whist, supper was partaken of, and then dancing was indulged in until 2 a.m. The arrangements were admirably carried out, and the evening was thoroughly enjoyed.

Manchester M.C.

The annual dinner and prize distribution, combined with a high-class entertainment, at the headquarters, the Albion Hotel, Piccadilly, Manchester, was held on the 19th inst. The club is probably the largest and most democratic mixed motor club in Great Britain. Mr. A. J. Bell, the president, in his speech, casually mentioned that the club comprised about 180 motor cyclists and 120 car owners. For the dinner this year the function was thrown open to ladies, who attended fairly well. Evening dress was compulsory, and there were about 140 present. Mr. J. Tytler, a well-known motor cycle member, had designed a beautiful menu card, which was a work of art, embellished with pictures relating to club life, with portraits of officials, etc. The motor cycle section attended in large numbers, outnumbering the car section; they are certainly more in evidence at all club gatherings and enthusiastic in club affairs than the car owners' section.

After the well-served dinner had been done full justice to, and one or two variety turns, the President (Mr. A. J. Bell) and Mr. F. C. Hunt presented the prizes for the year to those who had competed successfully in the numerous competitions. The prizes were a valuable and fine lot. A shout was raised when it was proudly announced that both the winners of the single and twin-cylinder class in the Isle of Man Auto Cycle T.T. Race (Messrs. Marshall and Reed) were members of the club, and had also won prizes in club competitions. The Humber vase (won by W. Andrew in 1905, A. V. Baxter in 1906, and Percy Butler in 1907) was presented to Mr. Andrew as the 1908 winner, as his own property.

The entertaining artistes were Ernest Hastings (entertainer), Cuthbert Allan (baritone), Olly Oakley (banjoist), Jerry Routledge (conjurer, etc.), and Alfred Martin (pianist), and their turns were greatly enjoyed. The whole affair passed off most successfully, being voted the most enjoyable of the kind promoted by the club.

Mr. Jones, a very popular member of the Liverpool Motor Club, who was successful in winning—in three of the club's competitions held during the year—two reliability trials and a hill climb.

The Motor Cyelling Club.

The annual general meeting of the club has been fixed for Wednesday evening, January 13th. The place of meeting will be announced later.

The club intends holding a few Sunday runs during the winter months, the first of which will be on January 3rd, to Burford Bridge, near Dorking.

A smoking concert will be held on Tuesday, February 16th. Arrangements for which are in the hands of Mr. J. Van Hooydonk. Mr. Hooydonk's smoker last year was a great success, and members are requested to keep this date open.

Nottingham and District M.C.C.

Mr. J. Van Hooydonk (Phoenix Motors, Ltd.) has kindly promised to lecture by lantern illustrations to the members of the above club. The lecture and concert in the interval have been arranged (by request of Mr. Hooydonk) for Saturday, January 9th next, at headquarters, Welbeck Hotel, Nottingham. All motor cyclists are cordially welcomed. A special invitation is extended to ladies and others interested in this increasingly popular sport. Tickets may be obtained from members of the committee, and by application to the hon. secretary, Mr. C. A. Aubert Spring, Stratford Road, West Bridgford, Notts., price 1s. each. The sale of such being limited, they will be allotted in the order of application.

The University of Birmingham M.C.

At a meeting held recently at the Birmingham University, it was decided that a motor club be formed, membership to be open to the staff and students (past and present) of the University. The following committee was elected. The officers: Chairman, Mr. Lomax; captain, Mr. Brewsted; vice-captain, Mr. West; hon. secretary, Mr. Crawley; and also Mr. Arledge and Mr. F. C. Mustard, technical advisers to the club. The annual subscription will be 10s. 6d. and 7s. 6d. for motor car and motor cycle members respectively. It was resolved that the club should affiliate with the Auto Cycle Union and associate with the Royal Automobile Club. Anyone interested should send a postcard to the secretary, R. C. Crawley, the University, Edgbaston, Birmingham.

Western District M.C.

The second annual dinner was held on the 15th inst. at headquarters, the Milford Hotel, Isleworth, when Mr. E. Smart presided over a large attendance of members and friends. After the tables had been cleared, and the loyal toast enthusiastically drunk, the Chairman proposed the toast of "The Club and its Officers," pointing out the enthusiasm which existed amongst the members, and congratulating the club upon its success during the past year. The response to this toast was in the hands of Mr. A. R. Canham. Mr. W. E. Prosser, and Mr. R. R. Babbage (hon. sec.) "The Chairman" was then proposed by Mr. W. E. Prosser, who referred to some of the motor experiences of Mr. Smart, to which that gentleman suitably responded. The next toast was that of "The Auto Cycle Union," given by Mr. P. W. Vinsen, who referred to the good work done for motor cyclists by that body, and the excellent manner in which its various trials and competitions were organised. To this Mr. F. Straight, the secretary of the A.C.U., replied, giving instances of some of the legal benefits received through affiliation to the A.C.U. He also congratulated the club on possessing a member who had secured a gold medal and certificate in the recent Land's End to John-o'-Groat's Trial. "The Ladies and Visitors" was given by Mr. Canham, who, after apologising for the fact that he was a bachelor, expressed the pleasure it afforded the members of the club to see so many ladies present, to which Mr. Nias responded on behalf of the ladies and visitors. "Our Host and Treasurer" was then proposed by Mr. W. E. Prosser, who referred to the efforts of Mr. Williams to make them comfortable at their headquarters—a fact which was greatly appreciated by all the members. Mr. T. A. Williams suitably replied. The speeches were interspersed with a most enjoyable musical entertainment, under the direction of Mr. Harry Edwards.

Members are requested to note that the annual general meeting will take place at headquarters, the Milford Hotel, Spring Grove, Isleworth, on Friday, January 8th, 1909, at 8 p.m. sharp. Any notice of motion and alteration to the rules must be posted to Mr. Wilson-Prosser, 73, Loveday Road, West Ealing, W., not later than January 1st.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Magneto Manufacture.

[3750.]—I have been reading with much interest letters that have appeared in your paper lately concerning magneto manufacture. Of course, everybody's is the best if you take their word for it. I think the best magneto is the B.A.T. magneto, i.e., Best After Tests. I should very much like to see some results of tests appear in *The Motor Cycle*, so as to give every maker a fair chance. I should like to add that certain firm exhibited at the Stanley Show some magnetos blazing away like one o'clock, but the speed, I should say, of these little blazers was nearer 3,000 than 300 revolutions per minute.

HENRY GRAFTON.

Belt Drive: Revival of an Old Controversy.

[3751.]—I see that nearly every maker of motor cycles is setting that most troublesome and inefficient belt drive on his 1909 models. I should like to know why? As a rider who has owned both belt and chain-driven machines, my experience shows that the belt cannot be compared to the chain for efficiency, lack of trouble, and small expense.

As for smoothness of running, I consider the chain in no way inferior to the belt, as the amount of slip can always be kept constant, which is an impossibility with the belt drive. Is it because the majority of motor cyclists are so incompetent that they cannot adjust the spring clutch, or that there is much greater profit on belt-driven machines?

MYSTIFIED.

In Praise of a Passenger Motor Cycle.

[3752.]—I was very much interested in the article under above heading written by "ED 232." I see the machine used is a 5-6 h.p. Roc with two-speed and free engine clutch. I presume the Amac carburettor with H.B. control and Bosch magneto are used. If I may, there are just a few questions I would like to ask "ED 232." What size spray and choke does he use to get eighty miles to a gallon of petrol? Does he use the standard 4 to 1 and 8 to 1 gears to do fifty miles per hour, and forty miles per hour with sidecar fixed? What about the average hill he can climb on top speed with the decar fixed?

I have been a rider of motor cycles and tricycles as well as good many years now, in the days of the tube ignition and when carburettors were as big as silencers are now, but the more I read and see the less I know, and that is why I should like an answer to my three simple questions.

STONEIR.

The Knight Engine.

[3753.]—A paragraph under the heading of Occasional comments, contributed by "Ixion," contains reference to the Knight engine, and states that "Since the power curves of the big Daimler engines are apparently better than any secured from a poppet valve engine of similar capacity."

This is not really true, and I enclose you herewith a power curve from a six-cylinder Napier engine of practically the same rating, from which you will see it is a very large advancement in the case of the poppet valve engine over his American one.

S. F. EDGE.

We have examined the power curve sent by Mr. Edge, which is a reproduction from the chart exhibited at the R.A.C. on the night of the discussion on Mr. Knight's paper. The power curve of the Napier is certainly superior to that of the Daimler, but that does not prove our contributor's statement to be untrue, because the bore and stroke of the Daimler engine are well-known, whereas the stroke of the Napier engine has not been disclosed.—ED.]

Organised Meets of Motor Cyclists.

[3754.]—I read with interest the letter of your correspondent, Mr. H. B. Renner [3726], and I am thoroughly in sympathy with it, especially with regard to the Midlands, where such a "monster meet" would indeed be welcome. The motor cyclists of Notts, Derbyshire, Leicestershire, Rutlandshire, and the adjoining counties certainly do want the opportunity of having the whole question of motor cycling and its future possibilities placed lucidly before them.

If, as your correspondent suggests, monster meets take place in, say, London, in the North, and in the West, I, personally, would indeed be pleased to assist such a similar monster meet to be arranged either here at Nottingham, or in the neighbouring towns, Leicester or Derby.

C. A. AUBERT SPRING,

Hon. sec. Nottingham and District M.C.C.

Road Dangers at Night.

[3755.]—The roads in Cambridgeshire are in a shocking condition at present, and perfectly dangerous to motor cyclists. The method of repairing is to put patches of unrolled stones on all parts of the road, which at night are very dangerous, to say nothing of the ruin of tyres. Cannot anything be done to wake the authorities up, and make them follow the methods of other counties? One can tell by the condition of the roads when one is out of this county.

C. E. B. K.

[3756.]—With reference to letter 3696 in the issue of December 2nd, I thoroughly and deeply sympathise with the writer thereof. I myself have quite recently recovered from the effects of a collision at night under circumstances very similar to those described by "AH 441." Certainly I have only just joined the ranks of true sportsmen—to wit, motor cyclists—still, I have fairly well mastered the rudiments of steady driving, so that the point under discussion strikes me with special force (figuratively speaking), almost as much as did actually the point projecting from the rear of the cart, which, I should imagine, came off the better in the conflict.

The night was a particularly dark one, even for our dismal climate, but on that I was rather congratulating myself, for did it not allow me to show off my new lamp, and the brilliancy of its light quite came up to expectations? But when nearing my journey's end, and not exceeding the rate of ten miles per hour, I was struck in the chest with such terrific force that I feel it to this day (it occurred about two months ago), and fear I may do so for many a long day yet.

The ludicrous byelaw relating to rear lights must surely appeal to all and sundry blessed with even a minimum of commonsense, so let it be our great duty, for our own safety, if not for that of the lay non-motorists, to agitate most vehemently against the existing law, and to have it set on a more reasonable footing.

And if, as all intelligent individuals are bound to admit, it is essential to have a danger light on the rear of slowly moving traffic, how much more necessary is it that we include therein cattle and suchlike, which not only are at times even stationary, but as often as not reverse their engines quite unexpectedly, with obviously possible disastrous results? I decidedly join my feeble voice with all who think like "AH 441."

M.D.

Tandem Attachments.

[3757.]—In the issue of the 9th inst. I see a letter from Mr. B. H. Davies re tandem attachments, and there are some points in which I consider he is wrong: (1.) *Re* skid, I rode a motor cycle tandem (3 h.p.) for several years, and my experience was that it side-slipped terribly and was quite

dangerous in wet weather. Pedal cyclists know that tandems slip more than singles. My experience with tandems, triplets, and quads has shown that the longer the wheelbase the more tendency there is to slip, and the harder it is to correct. I now ride an 8 h.p. twin single sometimes with another rider over back wheel, and I find it slips much less than the tandem, in spite of the higher horse-power. (2.) My tandem was controlled from the back and steered from the front, and I found the arrangement very good. I always had plenty to occupy one hand, and very often two, and sometimes three would have been useful, what with air, spark, and throttle levers and brakes. I had quite enough to do without steering: though I had to be always watching the road, yet my hands were not cumbered with the steering. With handle-bar control, perhaps front control and steering would be all right.

If Mr. Davies doubts what I say, I shall be glad to introduce him to several friends who have ridden thousands of miles on the said tandem.

L. JEZZI.

A Curious Coil Experience.

[3758.]—I recently had the following experience with my 9 h.p. motor cycle which may be of interest. After two or three months running I began to be troubled with contacts pitting and requiring trimming at frequent intervals. This got so bad that a few hours running was sufficient to pit and burn them to such an extent that it was impossible to start engine until they were trimmed up. They being iridium I knew that the condensers of coils had gone out of action. I wrote the makers of the coil and they requested me to send the coil to them for examination. I received the report that the wax had been dissolved by petrol; in fact, they said that the coil appeared to have been soaked in petrol, the smell of which when the coil was opened was very strong. Now all this must have been caused by the bad fitting screw stopper of the tank. I have constantly noticed the top of the tank wet owing to the splashing about of petrol, and it leaking down the screw threads of tank stopper, but I was astonished to find that it had travelled ten or twelve inches along top of tank and then run into coil compartment. The petrol that I have wasted must have been a big quantity. I am therefore fitting a Davidson stopper, hinged, and fitted with a catch. I only regret that the makers of the machine fitted such a wretched affair as they did, and which has been the cause of my trouble.

CB 246.

Motor Cycling in Natal.

[3759.]—For the benefit of others who may be hesitating as to which motor cycle is the most suitable for use on bad surfaced roads with numerous steep gradients, I wish to give my experience.

For about two years I have watched the performances of numerous types of cycles, and, without exception, the single-gear machines failed to surmount the local hills. I then purchased (in association with a friend) a much-advertised belt-driven two-speed geared cycle. This article might justly be called the all-trouble machine, for from the day it arrived to the present time it has continually needed attention and repairs.

My friend kindly took over altogether this cycle, and in consequence, after some deliberation, and, further, seeing the work done by, I believe, the only Phelon and Moore cycle then in the colony, I ventured with a considerable amount of doubt as to my wisdom to order one of these first-class machines. My purchase is a 1908 3½ h.p. Phelon and Moore, and it is really beautifully manufactured, and does all the makers claim for it. It takes me up the steepest hills and over roads with execrable surfaces. The latter are so bad that frequently one would come down on the rims if not driving carefully. In fact, it is quite evident that the manufacturers of all motor cycles have not yet realised what is required of their machines on colonial tracks, for it is an insult to designate them roads.

I am very pleased with the chain drive, to which I attribute half the success of the cycle. The starting is easy, and I do not think pedals would add to the excellence of the cycle. My advice to others situated under similar circumstances is, Buy a Phelon and Moore. I have no interest whatever in the firm, and write purely out of a desire to help doubters such as I was.

A. E. CARTE.

Richmond, Natal.

Sidecars.

[3760.]—The opinion that it is unsafe to drive a motor cycle with rigid sidecar attached unless the latter contains a passenger or is otherwise weighted down seems to be fairly generally held among motor cyclists, as is also the belief that such a combination is difficult to steer until one is quite used to it. I myself laboured under both of these delusions until, in the early part of the present year, I purchased a sidecar of the rigid type and attached it to the 3½ h.p. single-cylinder machine I was then using.

My first experience with the combination proved to my satisfaction that no difficulty existed so far as steering went, although I had never had any practice in managing a tricycle. With a passenger seated in the car, I started from the top of a hill and ran down with exhaust valve lifted, letting the engine fire when required, this, in my opinion, being the best way in which to make acquaintance with the new conditions.

Since then I have driven some hundreds of miles, both with and without a passenger, and, although possessing no more than the average skill in these matters, have never experienced any difficulty or accident. Quite recently I drove the 5 h.p. twin I am now using from London to High Wycombe with empty sidecar attached, over thirty miles of the worst grease and stones I have ever experienced, passing over some of the Marathon route, with its many sharp turns and short steep rises, the journey being accomplished without incident in 1h. 35m. under the conditions mentioned, added to which a thick fog prevailed in places. All that is required is a little judgment in turning sharp corners and when passing vehicles on cambered roads. I am keeping the sidecar permanently connected through the winter, as it effectively prevents side-slip.

H 4220.

[3761.]—I read Mr. Douglas Leechman's article on "The Sidecar" in *The Motor Cycle* of Dec. 2nd with much interest. At the outset Mr. Leechman says he proposes to deal with how far the bicycle loses its original character and acquires that of a tricycle by the addition of a sidecar.

Seeing he is the avowed champion of the rigid form of sidecar, it is easy to understand that he does not deal with the subject in its entirety, and at the risk of reopening this much debated subject, I should like, with your permission, to supply the missing links.

No doubt the bicycle and sidecar can be correctly described as a tricycle, seeing it has three wheels, but the English language of to-day is largely composed of words which carry an entirely different meaning in their application from the use of similar words long ago. I remember hearing a notable man lecturing on this subject (i.e., language, not sidecars), and he instanced the words "nervous man." Time back this was descriptive of a strong, quick, decisive individual, whereas now it describes a timid, irritable man. In the case of the word tricycle, it has come to be accepted as describing a safe and easy vehicle, more suitable for the unathletic, middle-aged man or woman than for vigorous youth.

When Mr. Leechman goes on to say "that the bicycle when connected to a rigid sidecar" assumes the usual characteristics of the three-wheeler," the inexperienced reader could easily be deceived into thinking this true under all circumstances, which it most certainly is not.

As a matter of fact, independent of theory, there is a great difference between a vehicle answering to the generally accepted term of tricycle and a motor cycle with rigidly attached sidecar, although both run on three wheels.

The difference is as follows: The former is an evenly balanced machine with the driver seated in the centre, applying the motive power from the centre, and steering from the centre; but the latter vehicle is a considerably wider machine, having the motive power, and practically all the weight, and the steering on one extreme side. The sidecar action comes nearer the tricycle when it has its full complement of two passengers, but when carrying driver only and minus passenger it naturally becomes difficult to steer, and is easily upset when on a cambered road or in the act of turning corners.

This result is, so obvious, and has been proved so many times, as to be beyond dispute.

It is well known, however, that when the sidecar is fitted with compensating joints the act of riding minus passenger is rendered easy and safe, and the advantages of this are easily realised.

I am quite ready to admit that no particular sidecar as at present constructed is perfect, and because of this my firm has pleasure in providing facilities for purchasers to test each type before finally deciding which particular kind suits them best.

W. MONTGOMERY.

Inlet Valve Design.

[3762.]—On page 987 "Ixion" describes what he calls a new type of inlet valve. I think "Ixion" does not look round much or he would have found this type was made and fitted years ago. The M.M.C., Coventry, fitted this pattern to my 2½ h.p. engine in 1906; also the Darracq people fitted it to their cars in 1903. I have a pair of these in use at the present time, and they have been in use since that date.

G. H. P.

Two-speed Gears and Overheating.

[3763.]—I note that lately the question whether two-speed twins are likely to overheat on the low gear has cropped up rather frequently, and thought my own experience might be interesting. My machine has a 6 h.p. Antoine engine, fitted in a Chater Lea frame, with the Nala two-speed hub, and also an adjustable pulley on engine. I find the engine remains quite as cool on the low gear when climbing a stiff hill as it does on the high gear and a level road, and, better still, if it is abnormally hot at the start, unless the throttle is wide open, it will begin to cool down.

I mentioned in letter No. 3487 a hill in North Wales with five gates across it. The pedal-starting gear of the Nala was not fitted on that tour, and I had to leave the engine running on the stand at the third and fourth ones, as a push-off restart would have been impossible, but in spite of that I was not troubled with overheating. The Hindhead, taken with loaded sidecar, or any of the North London test hills under the same conditions, will leave it quite normal in temperature, and nothing but bad driving will get it really hot.

Mr. Karslake invited me to try his Devonshire terror, but the great advantage of a two-speed twin is that you do not *think* you can get up a hill, you *know* you can, which is worth a lot in my opinion.

"Ixion's" note on handle-bar control levers reminds me that early this year I moved my handle-bar throttle lever so that I could keep my right thumb and first finger on it. The result was a drop in consumption from about seventy-two to over eighty miles to the gallon.

R. MEESON.

A Suggestion for Finger-posts.

[3764.]—When reading through the prospectus of one of the unions for motorists, I noticed that one of its many objects was the "negotiating with local authorities for the improvement of the roads." In view of this I would like to suggest an improvement that might be made with advantage in the matter of finger-posts.

I have lately been travelling through counties quite new to me, and although possessed of fairly good maps, depended to a great extent upon finger-posts. What frequently happened was this. On approaching cross-roads or fork-roads, I had to decide before reaching the finger-post which road to take if I wanted to avoid stopping. Sometimes the finger-post acted as a corroborative of my choice, and I joyfully popped on, but more often than not it told me, all too late, that I was on the wrong road. In either case it did good service indeed, but in the latter it necessitated dismounting and often occasioned "unautomobile" language.

Many finger-posts are almost invisible, while all are placed in such a position that they fail, in my humble opinion, to serve the purpose of cyclist or automobilist, or, indeed, of any road traffic.

I therefore suggest that, in future, the finger-posts be put on the left side of the road several yards before the cross-roads. Example:

Left, Mark Cross.

Right, Lamberhurst.

Forward, Tunbridge Wells.

In the case of fork-roads:

Left forward, Paddock Wood.

Right forward, Yalding.

Perhaps the above suggestion may meet with the approval of the unions, and, it is to be hoped, with successful "negotiating with local authorities."

D 4139.

A Suggestion for Piston Rings.

[3765.]—Re the question of oil burning on the top of pistons, I would like to say that my experience in gas engine practice has taught me that the grand secret of maintaining good lubrication and at the same time preventing oil from getting burnt on the piston is to make the piston rings rounded on their face instead of flat, as the sharp square corner scrapes off the oil as neatly as a knife, so wasting the oil and putting it where it is not wanted. When the rings get worn so that the rounding has disappeared it is time to either renew them or to have them again rounded. This system also reduces the wear. The reason of the action is simple. One can readily scrape off oil from a surface by means of a sharp edge, but one cannot do so by means of a round surface.

INCANDESCENT.

The Sheffield Club and the A.C.U.

[3766.]—I venture to question the statement of Mr. Turner, the hon. sec. of the Sheffield and Hallamshire Club, to the effect that that club was boycotted by the A.C.U. at the annual general meeting, and that the A.C.U. does not want the provincial members. With respect to the A.C.U. annual meeting a certain member of the Sheffield Club was not elected to the General Committee, and really, considering the treatment he served out to those of us who could not quite see eye to eye with him, he could hardly expect certain members of the A.C.U. to receive him with quite open arms.

As to the other statement, Mr. Turner is wrong. The A.C.U. does welcome the provincial clubs, and, as stated in the official journal, it is arranging a really acceptable and workable centre scheme, and it will, I believe, be found to be practically on the lines which the Sheffield representative and his friends on the "committee of eight" so contemptuously rejected. It, however, has been a case of quietly working along, unmindful of the remarks made from time to time. There is no doubt whatever that the Auto Cycle Union is, after all, the organisation for motor cyclists, and the clubs will do well to help it along.

G. J. WILKINSON.

SUMMARY OF OTHER CORRESPONDENCE.

Chas. Larard, 38, George Street, Hull, writes: "The object of the variable pulley illustrated on page 998 is to produce four speeds and a free engine at will. The gear is entirely operated by foot, leaving the hands free for controlling the machine."

The Premier Motor Co., Ltd., write: "The letter from the Rex Motor Co. appearing in your issue of the 16th inst. re spurious exhaust valves points out a very real grievance. As vendors of Rex spare parts we wish to make it clear that we do not descend to such dishonest trading as that complained of. All Rex components supplied by us are genuine new fittings exactly as sold by the Rex Co., and we have given a written undertaking to that effect."

Messrs. Leo Ripault and Co., the sole agents for Oleo sparking plugs, write: "An almost exact facsimile of the Oleo No. 4 plug is being sold in this country. The resemblance to the genuine article is complete with the exception that the porcelain does not bear the negro head trade mark and the bodies of the plugs are a fraction of an inch smaller. If any of your readers are offered such plugs, will they kindly communicate with us at 64a, Poland Street, Oxford Street, W.?"

EXPERIENCES WANTED.

"INTERESTED NORWEGIAN" would like readers' experiences with the Scott-Jowett motor cycle, particularly with regard to the engine, automatic carburetter, silencer, and ease of starting on the level and uphill.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

MOTOR BICYCLES FOR SALE.**SECTION III.**

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

21 h.p. Alldays Motor Cycle, good condition; £10, or nearest offer. — Stacey, Chatsworth Road, Chesterfield.

1907 3½ h.p. Quadrant, spring forks, not done 1,000 miles, equal to new; sacrifice £16 5s. — R. Else, Leawood, near Matlock.

TRIUMPH, 1907, splendid order, new Shamrock-Excelsior back, new Dermatine, Miraculum in back; £26 10s. — Vickers, Offley Grove, Newport, Salop.

5 h.p. Twin Rex, just had two new pistons, two new cylinders, also new valve case fitted, will climb anything, equal to new; money wanted; price £23. — F. Bayley, Victoria Street, Macclesfield.

SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northamptonshire, and Warwickshire.

1909 Triumph Motor Cycles from Stock; latest improvements; £48.

1908 Triumph Motor Cycles, shop-soiled; only £42.

ZENITH Bicar, 3½ h.p. engine, two-speed gear, in splendid order, very little used; £24.

MINERVA, 1½ h.p. engine, in good order and condition; trial given; £7 10s. — The Victoria Garage and Electrical Co., Ltd., Coventry.

TRIUMPH, 2½ h.p. Jap engine, in perfect order, plating and enamel as new, Dermatine-Bates non-skid; a bargain, £12. — Dowling, Dunchurch.

OFFERS wanted for 3½ h.p. Triumph, 2½ h.p. Triumph, 3½ h.p. Rex, 2½ h.p. Werner, 3½ h.p. Minerva, 3½ h.p. F.N., four cylinders; 16 h.p. light model Wolseley car, in new condition. — No. 1423, The Motor Cycle Offices, Coventry.

1908 Triumph, handle-bar control, Clinchers, Dermatine and two spare belts, lamp and generator, spare lamp, Cowey speed indicator, spare valve and cover (Palmer cord) and other spares, this is as good as new, and guaranteed in perfect order; price, cash £38. — J. W. Willson, Burgh, R.S.O.

SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SPECIALLY built for hills. — 2½ h.p. Spring Frame Bat, very low frame, first-class condition. — C. W. Unwin, Builder, Histon, Cambs.

SECTION VI.

Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

MOTO-REVE, new this summer, excellent climber, in perfect order, Shamrock rear tyre, lamp, stand, carrier, horn, number plates; nearest offer £28. — Green, Haverfordwest.

2½ h.p. M.M.C., Longuemare carburetter, 24 good reliable machine, just been enamelled and lined; £9 10s. cash; easy terms, or exchange. — Ward's, 24, Portman-moor Road, Cardiff.

MOTO-REVE, only used few times, studied cover, spring seat-pillar, Lucas lamp, two belts, carrier, stand, practically as new; £28, or near cash offer. — Box No. 1,436, The Motor Cycle Offices, Coventry.

SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, and Channel Islands.

4½ h.p. Stevens, B.S.A. frame, 2½ Palmer rear, Continental front, new condition everywhere, very powerful and fast; £25. — Full particulars, Kennedy, Fleet, Hampshire.

2 h.p. Ormonde, nearly new Edlin Sinclair tyres, Whittle's belt, handle-bar control, stand and carrier combined, good running order; 5 guineas. — Breeze, 74, High Street, Aldershot.

£40 for £29 10s.

A few BRAND NEW 3½ h.p. 1908 TOURIST REXES, magnetos, ball bearing engines, handle-bar control, 2½ tyres, makers' price £40. OUR PRICE £29 10s., or exchange.

£45 for £32 10s.

A few BRAND NEW 5 h.p. 1908 TWIN TOURIST REXES, magnetos, ball bearing engines, makers' price, £45. OUR PRICE £32 10s., or exchange.

PERFECTLY DESIGNED LIGHTWEIGHTS.

A few nearly new 2½ h.p. 1908 REX FEATHERWEIGHTS, magnetos, foot brakes, and all improvements. Weight 95 lbs. Handy and efficient. £19 19s., or exchange.

3½ h.p. MINERVA and SIDECAR, duplex steering, two-speed gear, and free engine	£17 17
3½ h.p. BROWN, magneto, spring forks....	22 10
2½ h.p. GERRARD, spring forks, two speeds	12 12
8 h.p. Steam Car, less boiler.....	8 15
4 h.p. N.S.U. TWIN, magneto, smart, two speeds	25 0
4½ h.p. TWIN MINERVA, magneto, 2½ in tyres	25 0
5 h.p. TWIN G.B., magneto, up to date	25 0
5 h.p. TWIN VINDEC (1907), magneto	29 10
5 h.p. TWIN ANTOINE, new	22 10
6 h.p. TWIN REX and Sidecar, four speeds	20 0
3½ h.p. TWIN WERNER, spring forks	11 13
3½ h.p. REX, 1907, very smart	15 15
3½ h.p. REX (1906), low built	14 14
4 h.p. ANTOINE, magneto, Roc two-speed	20 10
5½ h.p. REX-DE-LUXE, twin tyres, Roc clutch, magneto	27 10
4 h.p. ZENITH BICAR, free engine	16 16
3 h.p. RALEIGH, Phoenix two-speed gear	11 10
3½ h.p. ARIEL, M.O.V., low built	14 14
3½ h.p. MINERVA, Chater-Lea	13 13
4 h.p. ANTOINE, M.O.V., low	12 12
3 h.p. BRADBURY, vertical engine	10 10
3 h.p. QUADRANT, spring forks	10 10
3 h.p. ARIEL, M.O.V., low	10 10
5 h.p. TWIN REX, Osborne four-speed	17 17
2½ h.p. WERNER, vertical, low built	9 10
2½ h.p. MINERVA, 26 in. wheels	9 10

1909 MODELS.

All requiring a Motor Cycle for the 1909 season should call and inspect our grand selection of new and second-hand motor cycles. Most of the leading makes are represented.

As in previous years, we have decided to take any number of second-hand machines in part payment for new, as

**Triumphs,
F.N.'s,
Vindec,
Moto-Reves,
Douglas,
Rexes,
Bats,
Browns,**

**Motosacoche,
Nortons,
L.M.C.,
Humbers,
Rocs
Quadrants,
Fairys,
Etc.**

All who have a 1906, 1907, or 1908 machine should get our terms of allowance. We have every intimation of a great season this coming year. Orders should therefore be placed early to secure delivery when required.

Good market value will be allowed for second-hand models, and offers will be made by post subject to their tallying to description given at sight.

Copies of testimonials on application.

The "BROWN" Adjustable Motor Cycle Pulley.

The simplest and most effective pattern ever devised. The outer flange is adjustable to any width, and is fixed in position by a

locking ring that prevents any lateral movement whatever.

The outer nut (on main driving axle) not being recessed as is usually the case is readily accessible.

Can be supplied to fit any make of motor cycle.

Plated, Price 15/-.

Fitted to all 1909 models of the 'BROWN' Motor Bicycle without extra charge.

Don't let the damp play havoc with your machine, but instal your cycle house with a

"BROWN"

Carbotron Stove, which will keep it thoroughly weather-proof. No chimney or flue is required; it will burn without attention with no smoke, no smell, and no danger. Size 2ft. 3in. by 8in., price 20/-.

Carbotron Fuel is specially prepared for use in these stoves. It develops great heat and burns with very little draught. 1 cwt. bags, 16/-.

The "DUCO" TRIPLE-TWIST MOTOR CYCLE HORN.

$3\frac{1}{2}$ in., 5/6; $4\frac{1}{2}$ in., 7/- each

Triumph

THE TRIUMPH IS NOT AN IMITATION!

The Triumph is not an Imitation!

A motoring expert, writing in *The Motor*, gives his opinion that "Some manufacturers are for ever merely copyists, and, therefore, invariably a year behind."

Imitation has never yet surpassed the original; for one thing the original has moved a step forward, and further, all imitations lack as least one important factor—Brains.

The Triumph Motor Cycle is a notable case of the original. Never as yet has it been equalled, much less surpassed. Year after year it has led with others following in its wake, and to-day it stands pre-eminent amongst its fellows.

And why is this?

Its designers have the brains to originate, not for the sake of change, but for added efficiency and reliability—its constructors are mechanically skilled in carrying the design to a successful issue, and its material is specially chosen for its suitability and high-grade qualities.

Will you not learn more about this wonderful machine? Our descriptive catalogue, which is at your disposal, will be issued early in January—preliminary catalogue ready now—post free.

FOUND
ONLY
ON
1909
“VINDECS.”**

**WHAT MR. H. G. COVE
IN HIS PAPER
“MOTOR CYCLES AT THE
STANLEY SHOW,”
SAID ABOUT
“VINDEC SPECIAL”
MOTOR CYCLES:**

“After one has heard so much lately as to the better appearance, both in bad and fine weather, of the grey over the black finish of machines, it was really surprising to find that only one firm had the courage to wholly stage machines enamelled grey. I refer to the ‘Vindec Special,’ which well-known machines I feel will gain for themselves even greater popularity by their go-ahead methods. The frame is wholly in stone, or ‘Vindec’ grey. The panels of the tank are white, lined black, with borders of ‘Vindec’ grey, and the whole is the smartest idea in enamelling one could conceive. Another matter that has often struck me as strange is, that makers build machines with virtually fixed handle-bars, so that a man has to adapt himself to the handle-bar of the machine, instead of the handle-bar being adapted to the rider’s fancy or comfort. This certainly seems to be far from the correct method, and quite a roundabout way of getting at the ideal. The ‘Vindec’ machines are now fitted with handle-bars which have an adjustment for slope. A small nut on the forward lug has only to be slackened and a little pressure applied to raise or lower the bar to any height. This can be done without the length of the head stem being altered—a most desirable thing, and one which I feel sure will be very popular. An ingenious device for retaining the pedals in any position has been fitted, and the great discomfort so often experienced by the pedal swinging round when one is just about to mount is obviated. The carburetter this year on the ‘Vindec’ is placed in a central position, and I feel sure that this is an improvement.”

“Vindec” Riders are Satisfied Riders.

Let us send you the Booklet which illustrates and describes our 1909 Models.

**VINDEC MOTOR CYCLE CO.,

G. Co., Ltd., COVENTRY.

On account of the wonderful success of the "Gradua" Gear, a considerable number of motor cyclists—in spite of the greater amount of comfort offered in the "Zenette" Spring Frame bicycle—have approached us to know if we will fit this gear also to a rigid frame machine.

We have therefore designed a machine with rigid frame (but spring forks) to meet this demand. The "Zenith-Gradua" is not a copy of any other pattern, but has been specially designed, at great expense, by one of the first designers of the day. It has been thoroughly tested for many months before being put on the market. It is built low, but with long base, and has a decidedly smart and "racy" appearance, and is indeed a machine-de-luxe.

Price with 3½ h.p. Fafnir Engine, Fafnir or Longuemare Carburetter, Whittle or Rubber Belt, Druid Spring Forks, Handle-bar Control, Brooks' 100-B Saddle, 26 × 2½ Clincher Tyres, Michelin Butt-ended Tubes, Gear Driven Bosch Magneto, and with the infinitely variable "Gradua" Gear,
49 Guineas Net Cash.

THE "ZENITH-GRADUA."

"The Motor Cycle"—28th Oct., 1908—says of the "Zenith-Gradua": "A NEW MODEL.—Zenith Motors, Ltd., although they have found their spring frame model to have been a great success, have turned their attention also to the production of a lighter rigid frame model. The machine which we have under consideration is a *really sound job*, and from the trial we were able to enjoy in the dual capacity of both witness and participant we expect it to meet with considerable success. It will be seen that, as in the case of the spring frame 'Zenette,' the top tube is sloping, thus giving the rider a low saddle position, and we must congratulate Zenith Motors, Ltd., on utilising the sloping tube in order to obtain this end. The machine is fitted with handle-bar control, Druid spring forks, and 'Gradua' gear—that most ingenious contrivance, the excellent working of which we can vouch for personally after an extensive trial. On the one in six portion of one of the steepest hills in the London area, it twice ascended the hill in excellent form, and restarted on the gradient from a standstill without the slightest effort. In the saddle it is most comfortable, and after a short ride we found it to be easy to control, fast, and a good hill-climber. The 'Gradua' gear has now been before the public for some months and the makers have been wise enough to enter machines fitted with the gear in this year's long distance trials—the 'End-to-end Run' in particular—and it emerged with flying colours."

ZENITH MOTORS, LTD., WEYBRIDGE (SURREY). 30 minutes rail from Waterloo, L. & S.W.Ry.
 Trial runs by appointment only

Consider Comfort.

We have made it our first consideration, and a glance at the illustration will show the means we have adopted to bring to every rider of a motor cycle the maximum of same.

Note particularly the sectional view of springs which will make clear to you their compensating action—the one in tension—the other in compression.

These are fitted to all models of the

BROOKS

ANTI-VIBRATORY MOTOR CYCLE SADDLES AND SEATS.

Their embodiment ensures the complete absorption of all vibration within themselves and a resulting ease and absence of fatigue which will be immediately appreciated by every rider. At the same time, that common fault—a tendency to bounce—is entirely eliminated.

That is comfort, and you should ask to see and test a BROOKS—in the meantime write us for Saddle Manual. Dept. B 45.

J. B. BROOKS & Co., Ltd.,

The Saddle Specialists,
BIRMINGHAM.

IF YOU WANT

a downright reliable machine, with all the most up-to-date comforts and refinements, you cannot do better than place your order **now**. The ROC is the one machine you must sooner or later come to. The ROC has **always** been the pioneer model to the world. Notice how the ROC clutch and speed gear, with hand starting, has altered old notions, and how other firms are following the lead. Notice also the safe and easy riding position—the long wheelbase—the strong duplex frame construction—the divided duplex tanks, and above all, the ROC patent duplex spring fork with telescopic movement. This fork alone was the greatest improvement shown at the Stanley Show.

Bound in leather, with pocket for inserting licence. Price 3/- nett, post free 3/3.

All the above books may be obtained by post if ordered (with remittance) from "The Motor Cycle," Offices, 20, Tudor Street, London, E.C. M M M

Nothing

can tempt an up-to-date motorist if cheapness of an article is proclaimed as its principal feature. This is well understood by all who are in the know, and it does not take long to convince sporting friends that specially in the rubber line many articles are put upon the market which are everything

but

suitable for the purpose. In the way of Tyres the year 1908 has proved that the old fashioned plain tread tyre is no longer wanted. Something better was required, and the appearance of the rubber studded Shamrock Excelsior was universally acclaimed. The introduction of same was a complete success, and nothing but

Praise

is heard of all who have used them. Made of special wear resisting quality, the construction allows great resiliency and comfort; of all imitations at the end of the season none come near the Non-Skid qualities of the Shamrock Excelsior, and it may truly be said that they are incomparable with any other.

For

popularity no tyre has ever achieved such rapid progress; remember London-Edinburgh, Six Days' Trials, etc., etc., in which S. E. Tyres outclassed by far all others; the year 1909 will add many friends to the already large number of users. Another line which has constantly increased in popularity and is acknowledged as the British favourite is the

Shamrock

Gloria Rubber Belt. All manufactures of high-class machines fit the S.G. as Standard Belt. Stanley Show, 1908: all N.S.U., all Vindec, all Rex, all Bat, all Roc, and the majority of Triumph machines have S.G. Belts. This settles the question of merit and popularity. Britain's best known amateurs and leading authorities acclaim and testify to the high standard of our

Specialities

in our new booklet; ask for a free copy with prices, which are revised and reasonable.

Retreading successfully carried out.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—1d. per word, minimum 1s. Name and address must be counted. In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Friday morning, or sent to London (20, Tudor Street, E.C.), on the Thursday afternoon previous to the date of publication.

CLASSIFICATION BY LOCALITY

For the convenience of purchasers of second-hand motor cycles, it has been suggested that the advertisements be classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Experimentally, therefore, we have divided the advertisements into eleven sections, as follows:

Plan showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmorland.

SECTION II.
York and Lancashire.

SECTION III.
Charnovon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

SECTION V.
Huntingdon, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.
Gloucester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.
Oxford, Bucks, Wilts, and Hants, Channel Islands.

SECTION VIII.
Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.
Devon, Dorset, and Cornwall.

SECTION X.
Wales and Isle of Man.

SECTION XI.
Wales and Isle of Man.

1909. IS VERY NEAR

It is time to see about exchanging your old machine for a 1909

Telegrams: "Primus, B'ham."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, and upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of 1s. for registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe and Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

All letters relating to advertisements must state distinctly under what heading they appeared, and date of issue.

MOTOR BICYCLES FOR SALE.

PRICE 2/6 NET. POST FREE 2/10

The Offices of "THE MOTOR CYCLE," 20, Tudor St., London, E.C.

1909 Handle-bar Controlled CARBURETTOR.

Some of its Features :

**EFFICIENCY, LIGHTNESS, STRENGTH,
DURABILITY, AND ADAPTABILITY.**

Supplied complete, ready to fit any machine. The length of cabling required, and the diameter of cylinders only need be given. Supplied for 1907 or 1908 "Triumphs," and can be fitted without any alteration to any of the existing parts.

A Customer writes :

"My machine, with your Handle-bar Controlled Carburettor fitted, is streets ahead of any other, and as for the handle-bar control—well, with apologies to the Waverley Pen people, it is a boon and a blessing to motor cyclists."

Can be seen at :

13, Cecil Court, Charing Cross Road, W.C. (Mr. Carpenter). 5, West Regent Street, Glasgow (Mr. Trevor). And at Messrs. Brown Bros., East London Rubber Coy., and the Service Coy., High Holborn, W.C.

After 7 Years

Dec. 8th.

Milford,
Co. Carlow.

Perhaps you will remember I got a 2 1/2 h.p. Motor Bicycle from you about seven years ago. I was riding it to-day and got a bad side-slip and broke the driving axle to which the pedals are attached in two, and should be obliged if you would send me a new one as soon as possible as I am badly in need of the machine. I might mention the machine has been doing very well, and expect to be up your way after Xmas, when I will call in on you as there are two or three small things want seeing to.

(Signed) F. E. BAYLEY.

CLECKHEATON, Yorks.**

To those who prefer a Lightweight

the $1\frac{3}{4}$ h.p. F.N. just fits the requirements of the man who is particular—the man who has studied motor cycling and knows what goes to make a modern machine as near perfection as is possible.

There's an air of satisfaction about the owner of an F.N. Lightweight. Notice the confidential way he sets out for a ride. Observe him in any place where motor cyclists congregate, and you'll find after his criticism of machines about him he returns with pride to his own mount.

This is not rhetoric, it is the outcome of observation.

The F.N. $1\frac{3}{4}$ h.p. Lightweight is built by mechanics under the supervision of authorities who have to please Government requirements.

It is just right in weight, has a wonderfully flexible engine and attains a speed of anything from a crawl to well above the limit.

Its spring forks are a revelation in shock absorbing devices, and its movable pulley allows belt adjustment without dismounting.

Its frame is compact, neat, and built with just the right leg stretch, and to the man, professional or otherwise, who wants a machine that will take him there and back, there is nothing ever been built that for efficiency and thorough reliability approaches the handy and durable F.N. $1\frac{3}{4}$ h.p. Lightweight at

£35. ¹⁵
